

## **High Efficiency, 36V 100mA Synchronous Step-Down Converter**

### **General Description**

The RT6208 is a high-efficiency, monolithic synchronous step-down DC/DC converter that can deliver up to 100mA output current from a 4.5V to 36V input supply. It requires only 25μA typical supply current at no load while maintaining output voltage regulation. The RT6208 achieves Boundary Conduction Mode (BCM) operation, low quiescent current and programmable high-side peak current limit, providing high efficiency over a wide range of load currents. It also provides soft-start protection to eliminate input current surge during start-up. The low current (3μA) shutdown mode provides output disconnect, enabling easy power management in battery-powered systems. The RT6208 is available in a SOT-23-6, SOT-23-8 and SOP-8 (Exposed Pad, with power good function) packages.

### **Ordering Information**

RT6208	□□
	└─ Package Type
	SP : SOP-8 (Exposed Pad-Option 1)
	E : SOT-23-6
	V8 : SOT-23-8
	└─ Lead Plating System
	G : Green (Halogen Free and Pb Free)

Note :

Richtek products are :

- ▶ RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶ Suitable for use in SnPb or Pb-free soldering processes

### **Features**

- Achieves Very High Efficiency in Low Load Conditions
- ±1% High Accuracy Feedback Voltage
- 4.5V to 36V Input Voltage Range
- 100mA Output Current
- Integrated High-Side and Low-Side Switches
- No Compensation Required
- Low Quiescent Current
- Adjustable Peak Current Limit
- Cycle-by-Cycle Over Current Protection
- Input Under Voltage Lockout
- Internal Soft-Start
- Thermal Shutdown Protection

### **Applications**

- Wireless Charger
- Industrial and Commercial Low Power Systems
- Green Electronics/Appliances
- Point of Load Regulation for High-Performance DSPs
- MCU Supply in Wireless LED Lighting

SOT-23-8

## Functional Pin Description

Pin No			Pin Name	Pin Function
SOP-8 (Exposed Pad)	SOT-23-6	SOT-23-8		
1	6	4	SW	Switch Node. Connect The Switching Node To External Inductor.
2	5	3	VIN	Input Supply Voltage. Must bypass with a suitably large ceramic capacitor.
3	--	--	NC	No Internal Connection.
4	4	1	ISET	High-Side Peak Current Set Pin. A resistor from this pin to GND sets the high-side peak current limit. Leave floating for the maximum peak current, 225mA. Short this pin to GND for the minimum peak current, 50mA. A 1μA current is sourced out of this pin.
5	3	8	EN	Enable Control Input. A voltage on this pin above 1.25V enables the converter into normal mode; forcing this pin below 0.3V shuts down the IC, reducing quiescent current to 3μA. An internal 2μA current pulls up enable pin for automatic startup.
6	1	7	FB	Feedback Voltage Input. This pin receives the feedback voltage from a resistive divider connected across the output.
7	--	6	PGOOD	Power Good Open Drain Output. Asserts low if output voltage is low due to OTP, UVP, UVLO, EN shutdown or during soft-start.
8, 9 (Exposed Pad)	2	2	GND	Power Ground. The exposed pad must be soldered to a large PCB and connected to GND for maximum power dissipation.
--	--	5	AGND	Analog Ground.

## Function Block Diagram

## Operation

The RT6208 is a step-down DC/DC converter with internal power switches that uses Hysteresis Mode control, combining low quiescent current, which results in high efficiency across a wide range of load currents. Hysteresis Mode operation functions by using Boundary Conduction Mode (BCM) to ramp the inductor current through the internal power switches, followed by a sleep cycle where the power switches are off and the load current is supplied by the output capacitor. During the sleep cycle, the RT6208 draws only 25μA of supply current. At light loads, the BCM cycles are a small percentage of the total cycle time which minimizes the average supply current, greatly improving efficiency.

### Scheme of Hysteresis Mode

The feedback comparator monitors the voltage on the  $V_{FB}$  pin and compares it to an internal 800mV reference, as shown in Figure 1. If this voltage is greater than the reference, the comparator activates a sleep mode in which the power switches and current

comparators are disabled, reducing the VIN pin supply current to only 25μA. As the load current discharges the output capacitor, the voltage on the  $V_{FB}$  pin decreases. When this voltage falls 5mV below the 800mV reference, the feedback comparator trips and enables BCM. At the beginning of the BCM, the internal high-side power switch (P-channel MOSFET) is turned on and the inductor current begins to ramp up. The inductor current increases until either the current exceeds the peak current comparator threshold, or the ON time of the high-side MOSFET exceeds 5μs during the time  $V_{FB}$  is higher than 800mV, at which the high-side power switch is turned off, and the Low-side power switch is turned on. The inductor current ramps down until the reverse current is close to zero. If the voltage on the  $V_{FB}$  pin is still less than the 800mV reference, the high-side power switch is turned on again and another cycle commences which keep the inductor current operated in a boundary conduction mode. The average current during the BCM will normally be greater than the average load current. For this architecture, the maximum average output current

is equal to half of the peak current. The hysteresis nature of this control architecture results in a switching frequency that is a function of the input voltage, output voltage and inductor value. This behavior provides inherent short-circuit protection. If the output is shorted

to ground, the inductor current will decay very slowly during a single switching cycle. Since the high-side switch turns on only when the inductor current is near zero, the RT6208 inherently switches at a lower frequency during short-circuit condition.

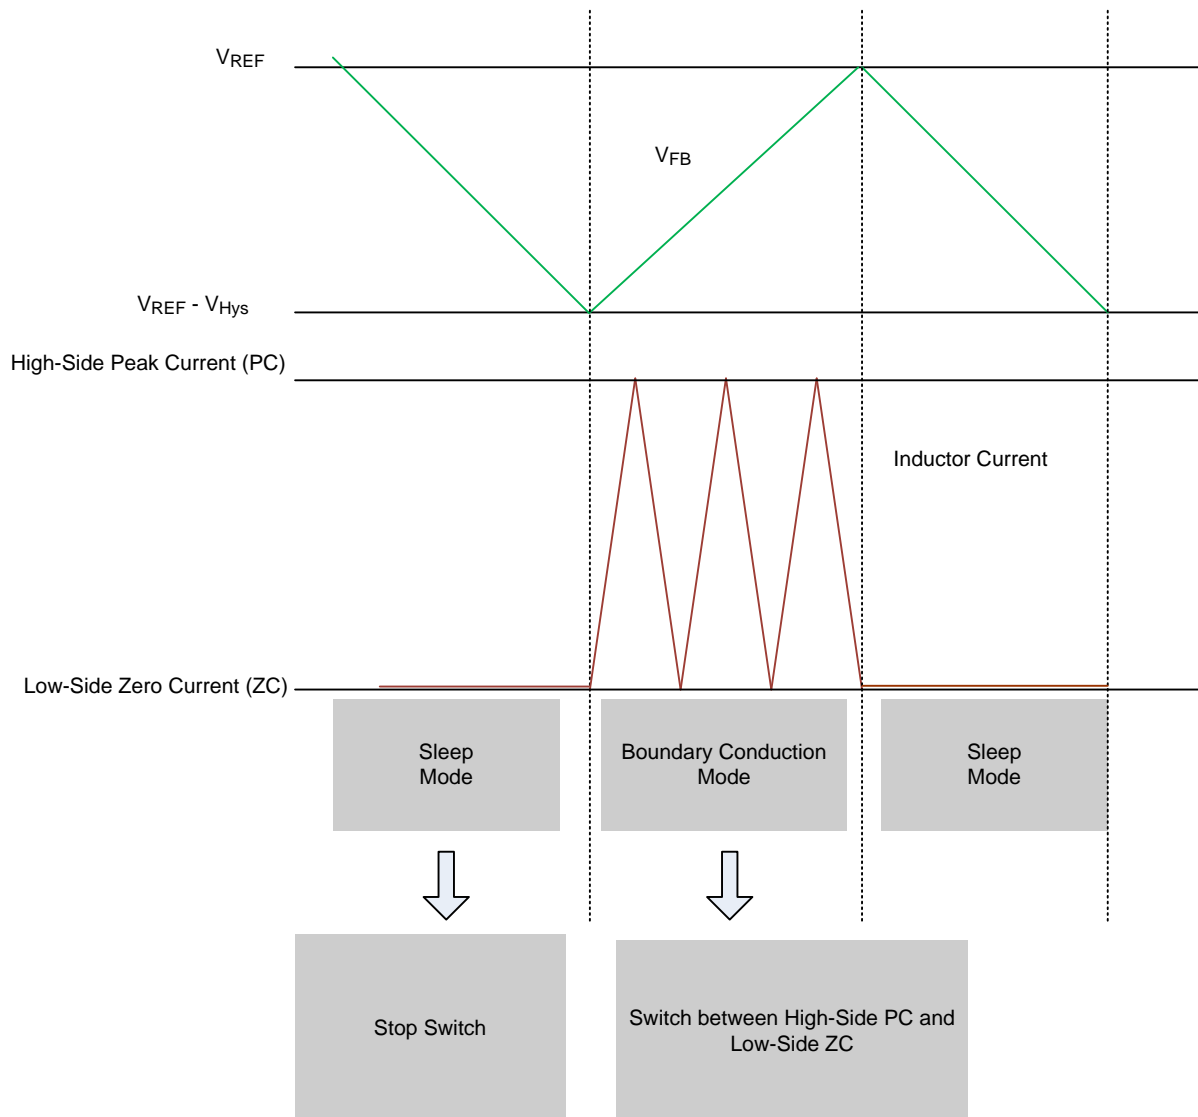

Figure 1. Hysteresis Mode

## Absolute Maximum Ratings (Note 1)

• Supply Voltage, VIN	-----	-0.3V to 40V
• Switch Voltage, SW	-----	-0.3V to (VIN + 0.3V)
• All Other Pins	-----	-0.3V to 6V
• Power Dissipation, PD @ TA = 25°C		
SOP-8 (Exposed Pad)	-----	3.26W
SOT-23-6	-----	0.48W
SOT-23-8	-----	0.53W
• Package Thermal Resistance (Note 2)		
SOP-8 (Exposed Pad), $\theta_{JA}$	-----	30.6°C/W
SOP-8 (Exposed Pad), $\theta_{JC}$	-----	3.4°C/W
SOT-23-6, $\theta_{JA}$	-----	208.2°C/W
SOT-23-6, $\theta_{JC}$	-----	32°C/W
SOT-23-8, $\theta_{JA}$	-----	186.2°C/W
SOT-23-8, $\theta_{JC}$	-----	47.4°C/W
• Lead Temperature (Soldering, 10 sec.)	-----	260°C
• Junction Temperature	-----	150°C
• Storage Temperature Range	-----	-65°C to 150°C
• ESD Susceptibility (Note 3)		
HBM (Human Body Model)	-----	2kV
MM (Machine Model)	-----	200V

## Recommended Operating Conditions (Note 4)

• Input Voltage Range	-----	4.5V to 36V
• Ambient Temperature Range	-----	-40°C to 85°C
• Junction Temperature Range	-----	-40°C to 125°C

## Electrical Characteristics

(VIN = 12V, TA = 25°C, unless otherwise specified)

Parameter		Symbol	Test Conditions	Min	Typ	Max	Unit

**Note 1.** Stresses beyond those listed “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

**Note 2.**  $\theta_{JA}$  is measured at T<sub>A</sub> = 25°C on a high effective thermal conductivity four-layer test board per JEDEC 51-7.  $\theta_{JC}$  is measured at the exposed pad of the package.

**Note 3.** Devices are ESD sensitive. Handling precaution recommended.

**Note 4.** The device is not guaranteed to function outside its operating conditions.

## Typical Application Circuit

## Application Information

The typical RT6208 application circuit is shown on page 7 of this data sheet. External component selection is determined by the maximum load current requirement and begins with the selection of the peak current programming resistor,  $R_{ISET}$ . The inductor value  $L$  can then be determined, followed by capacitors  $C_{IN}$  and  $C_{OUT}$ .

### Peak Current Resistor Selection

The peak current comparator has a maximum current limit of 225mA nominally, which results in a maximum average current of 112mA. For applications that demand less current, the peak current threshold can be reduced to as little as 50mA. The threshold can be easily programmed with an appropriately chosen resistor ( $R_{ISET}$ ) between the ISET pin and ground. The value of resistor for a particular peak current can be computed by following equation

$$R_{ISET} = (I_{PEAK} - 0.05) \times 5.88 \times 10^6$$

where  $50\text{mA} < I_{PEAK} < 225\text{mA}$ .

The peak current is internally limited to be within the range of 50mA to 225mA. Shorting the ISET pin to ground programs the current limit to 50mA, and leaving it floating sets the current limit to the maximum value of 225mA. When selecting this resistor value, be aware that the maximum average output current for this architecture is limited to half of the peak current. Therefore, be sure to select a value that sets the peak current with enough margin to provide adequate load current under all foreseeable operating conditions.

### Output Voltage Setting and Feedback Network

The resistive divider allows the FB pin to sense the output voltage. The output voltage is set by an external resistive voltage divider according to the following equation :

$$V_{OUT} = V_{REF} \times \left( 1 + \frac{R_1}{R_2} \right)$$

Where  $V_{REF}$  is the reference voltage (0.8V typ.).

The resistive divider attenuates the ripple signal on FB pin as well. A small feed forward capacitor  $C_{FF}$  can be added in parallel with the upper feedback resistor  $R_1$ . It helps to reduce switch-noise coupling on the FB pin and increases the FB pin ripple voltage to improve switching stability and avoid double pulses. The  $C_{FF}$  value is dependent on the feedback network impedance and the peak-peak ripple voltage on the output. Recommended  $C_{FF}$  values range from 47pF to 470pF.

### Inductor Selection

The inductor, input voltage, output voltage and peak current determine the switching frequency of the RT6208. For a given input voltage, output voltage and peak current, the inductor value sets the maximum switching frequency when the load current is close to 1/2 of the peak current. A good first choice for the inductor value can be determined by the following equation :

$$L = \left( \frac{V_{OUT}}{f_{MAX} \times I_{PEAK}} \right) \times \left( 1 - \frac{V_{OUT}}{V_{IN}} \right)$$

The variation in switching frequency would be calculated with inductor, load current, input and output voltage. Large output capacitors will result in multiple switching cycles in BCM. The discharge time and charge time of operation frequency can follow below equation :

$$\text{Discharge time (Sleep Mode)} : T_1 = C_{OUT} \times \frac{V_{Hys.}}{I_{LOAD}}$$

Charge time (Boundary Conduction Mode) :

$$T_2 = C_{OUT} \times \frac{V_{Hys.}}{(0.5 \times I_{PEAK} - I_{LOAD})}$$

$$\text{Operation Frequency } f = \frac{1}{T_1 + T_2}$$

### Input Under Voltage Lockout

The RT6208 implements a protection feature which disables switching when the input voltage is too low. If  $V_{IN}$  falls below 3.9V typical, an under voltage detector disables switching. Switching is enabled when the input voltage exceeds 4.2V typical (4.5V maximum).

### Enable Operation

The EN pin can be used to shutdown or activate the chip. Pulling the EN pin low (<1V) will shutdown the device. During shutdown mode, the RT6208 quiescent current drops to lower than 3 $\mu$ A. Driving the EN pin high (>1.4V) will turn on the device again. Leaving the EN pin floating will pull the EN pin up to 2V internally and enable RT6208.

### Soft-Start

The RT6208 provides an internal soft-start function to prevent large inrush current and output voltage overshoot when the converter starts up. The soft-start automatically begins once the chip is enabled. During soft-start, it clamps the ramp of internal reference voltage which is compared with FB signal. The typical soft-start duration is 1ms.

### $C_{IN}$ and $C_{OUT}$ Selection

The input capacitance,  $C_{IN}$ , is needed to filter the triangular current at the Source of the high-side MOSFET. To prevent large ripple current, a low ESR input capacitor sized for the maximum RMS current should be used. The approximate RMS current equation is given :

$$I_{RMS} = I_{OUT(MAX)} \frac{V_{OUT}}{V_{IN}} \sqrt{\frac{V_{IN}}{V_{OUT}} - 1}$$

This formula has a maximum at  $V_{IN} = 2V_{OUT}$ , where  $I_{RMS} = I_{OUT} / 2$ . This simple worst case condition is commonly used for design because even significant deviations do not offer much relief. Choose a capacitor rated at a higher temperature than required. Several capacitors may also be paralleled to meet size or

height requirements in the design.

The output capacitor,  $C_{OUT}$ , filters the inductor's ripple current and stores energy to satisfy the load current when the RT6208 is in sleep mode. The value of the output capacitor must be large enough to accept the energy stored in the inductor without a large change in output voltage. To achieve an output voltage peak-peak ripple less than 1% of the output voltage, the output capacitor must be :

$$C_{OUT} \geq 50 \times L \times \left( \frac{I_{PEAK}}{V_{OUT}} \right)^2$$

### Thermal Considerations

For continuous operation, do not exceed absolute maximum junction temperature. The maximum power dissipation depends on the thermal resistance of the IC package, PCB layout, rate of surrounding airflow, and difference between junction and ambient temperature. The maximum power dissipation can be calculated by the following formula :

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

where  $T_{J(MAX)}$  is the maximum junction temperature,  $T_A$  is the ambient temperature, and  $\theta_{JA}$  is the junction to ambient thermal resistance.

For recommended operating condition specifications, the maximum junction temperature is 125°C. The junction to ambient thermal resistance,  $\theta_{JA}$ , is layout dependent. For SOP-8 (Exposed Pad) package, the thermal resistance,  $\theta_{JA}$ , is 30.6°C/W on a standard JEDEC 51-7 four-layer thermal test board. For SOT-23-6 package, the thermal resistance,  $\theta_{JA}$ , is 208.2°C/W on a standard JEDEC 51-7 four-layer thermal test board. For SOT-23-8 package, the thermal resistance,  $\theta_{JA}$ , is 186.2°C/W on a standard JEDEC 51-7 four-layer thermal test board. The maximum power dissipation at  $T_A = 25^\circ\text{C}$  can be calculated by the following formula :

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (30.6^\circ\text{C/W}) = 3.26\text{W for SOP-8 (Exposed Pad) package}$$

$P_{D(MAX)} = (125^{\circ}\text{C} - 25^{\circ}\text{C}) / (208.2^{\circ}\text{C/W}) = 0.48\text{W}$  for  
SOT-23-6 package

$P_{D(MAX)} = (125^{\circ}\text{C} - 25^{\circ}\text{C}) / (186.2^{\circ}\text{C/W}) = 0.53\text{W}$  for  
SOT-23-8 package

The maximum power dissipation depends on the operating ambient temperature for fixed  $T_{J(MAX)}$  and thermal resistance,  $\theta_{JA}$ . The derating curve in Figure 2 allows the designer to see the effect of rising ambient temperature on the maximum power dissipation.
