

Triple Channel PWM Controller for AMD SVI3 CPU/GPU Core Power Supply

1 General Description

The RT3674FE is a synchronous buck controller which supports triple output rails and can fully meet AMD SVI3 requirements. The RT3674FE adopts G-NAVP™ (Green Native AVP), which is Richtek's proprietary topology derived from finite DC gain of EA amplifier with current mode control, making it easy to set the droop to meet all AMD CPU/GPU requirements of AVP (Adaptive Voltage Positioning). Based on the G-NAVP™ topology, the RT3674FE features a new generation of quick response mechanism (Adaptive Quick Response, AQR) to optimize AVP performance during load transient and reduce output capacitors. The RT3674FE integrates a high accuracy ADC for reporting and a non-volatile memory (NVM) to store custom configurations, such as output current scale, auto phase add/drop threshold, switching frequency, overcurrent threshold or AQR trigger level. It also features complete fault protection functions including overvoltage (OV), undervoltage (UV), overcurrent (OC) and undervoltage lockout (UVLO). The RT3674FE provides independent enable, power good and temperature sense for each output rail. It also supports several functions which can be set by I²C interface.

2 Applications

- SVI3 AMD Core Supply
- Desktop and Notebook Computer
- AVP Step-Down Converter

3 Features

- AMD SVI3 Rev 1.01 Compatible
- 4/3/2/1 Phase (Rail A) +1 Phase (Rail B) +1 Phase (Rail C) PWM Controller
- G-NAVP™ (Green Native Adaptive Voltage Positioning) Topology
- 0.5% DAC Accuracy
- Differential Remote Voltage Sensing
- Built-in ADC for Reporting
- Accurate Current Balance
- Diode Emulation Mode (DEM) at Light Load
- Fast Transient Response: Adaptive Quick Response (AQR)
- OVP, OCP and UVP with Flag
- Switching Frequency Setting
- Auto Phase Add/Drop with DEM for Excellent Efficiency
- Voltage on the Fly (VOTF) Enhancement
- Acoustic Noise Suppression
- Zero Load-line
- Standard I²C Protocol Interface
 - ▶ Internal Non-Volatile Memory (NVM) to Store Custom Configurations
 - ▶ Current Balance Gain Adjustment for Thermal Balance
 - ▶ Dynamic Load-line Setting
 - ▶ Voltage Offset Setting
 - ▶ Fixed VID Setting
 - ▶ Protection Report and Protection Disable
 - ▶ Output Voltage/Output Current/Temperature/ Input Power Monitoring
- Soldering Good Detection
- Small 60-Lead WQFN Package

8 Functional Pin Description

Pin No.	Pin Name	Pin Function
1	VSEN_A	Positive differential voltage sense input for rail A. Connect to positive remote sensing point and should be routed with RGND_A as a differential pair.
2	RGND_A	Negative differential voltage sense input for rail A. Connect to negative remote sensing point.
3	COMP_A	Error amplifier output of rail A.
4	FB_A	Error amplifier voltage feedback of rail A.
5	ISEN4N_A	Phase #4 current sense inputs of rail A. The ISEN4N_A and ISEN4P_A pins are used to differentially sense the corresponding channel current. Connecting ISEN4P_A to VCC programs 3-phase operation.
6	ISEN4P_A	
7	ISEN2N_A	Phase #2 current sense inputs of rail A. The ISEN2N_A and ISEN2P_A pins are used to differentially sense the corresponding channel current. Connecting ISEN2P_A to VCC programs 1-phase operation.
8	ISEN2P_A	
9	ISEN1N_A	Phase #1 current sense inputs of rail A. The ISEN1N_A and ISEN1P_A pins are used to differentially sense the corresponding channel current. Connecting ISEN1P_A to VCC if rail A is not used.
10	ISEN1P_A	
11	ISEN3N_A	Phase #3 current sense inputs of rail A. The ISEN3N_A and ISEN3P_A pins are used to differentially sense the corresponding channel current. Connecting ISEN3P_A to VCC programs 2-phase operation.
12	ISEN3P_A	
13	ANS_EN	Acoustic Noise Suppression function setting. When the pin is pulled to VCC, this function can be enabled. This pin is not allowed to be floating.
14	VIN	VIN input pin. Connect a low-pass filter to this pin to set on-time.
15	PSYS	System input power monitor. Place the PSYS resistor as close to the IC as possible. Pulling this pin to VCC can disable PSYS function.
16	PWM4_A	Phase #4 rail A PWM output. This signal is used to drive the PWM input of the FET driver IC. Unused PWM pins should be left unconnected. The PWM tri-state windows can be selected by NVM. One is 1.6V to 2.2V and the other is 1.4V to 2.1V. The PWM output high level is pulled up to VCC (5V) and low level is pulled down to GND.
17	PWM2_A	Phase #2 rail A PWM output. Refer to PWM4_A description.
18	PWM1_A	Phase #1 rail A PWM output. Refer to PWM4_A description.
19	PWM3_A	Phase #3 rail A PWM output. Refer to PWM4_A description.
20	RESET_L	Input pin of SVI3 interface. Active low signal causes all SVI3 state machines and SVI3 define registers to reset to default states.
21	PS_A/PS_B	External driver mode control. The PS_A/PS_B pin can be configured as rail A or rail B by NVM. This pin can work with RT9637 to drive two power stages with single PWM signal. As PSI0 command is received, this pin is in low state. As PSI1 and PSI2 command are received and phase count is 1, this pin is in floating state. As PSI3 and PSI6 command are received, this pin is in high state.
22	PWREN_A	Active high output enable input pin for rail A. Faults are cleared when PWREN_A is toggled but no effect on the sticky FAULT_STATUS bits.
23	PWREN_C	Active high output enable input pin for rail C. Faults are cleared when PWREN_C is toggled but no effect on the sticky FAULT_STATUS bits.
24	PWREN_B	Active high output enable input pin for rail B. Faults are cleared when PWREN_B is toggled but no effect on the sticky FAULT_STATUS bits.
25	SDA	I ² C data signal.

Pin No.	Pin Name	Pin Function
26	SCL	I ² C clock signal.
27	DRVEN	External driver mode control. As PSI6 command is received, this pin is in low state. The output high level is VCC.
28	DRVEN_F	External driver mode control. As PSI6 command is received, this pin is in floating state. The output high level is VCC.
29	PWM1_B	Phase #1 Rail B PWM output. Refer to PWM4_A description.
30	PWRGD_B	Power Good indicator for rail B. This open-drain output requires an external pull-up resistor. PWRGD_B is pulled low when a shutdown fault occurs.
31	ISEN1P_B	Phase #1 current sense inputs of rail B. The ISEN1N_B and ISEN1P_B pins are used to differentially sense the corresponding channel current. Connect ISEN1P_B to VCC if rail B is not used.
32	ISEN1N_B	
33	VSEN_B	Positive differential voltage sense input for rail B. Connect to positive remote sensing point and should be routed with RGND_B as a differential pair.
34	RGND_B	Negative differential voltage sense input for rail B. Connect to negative remote sensing point.
35	COMP_B	Error amplifier output of rail B.
36	FB_B	Error amplifier voltage feedback of rail B.
37	OCP_L	Output pin of SVI3 interface. This open-drain output requires an external pull-up resistor. Asserted when output current is greater than OCP threshold or OCP warning threshold. The three rails of the controller share one OCP_L pin.
38	PWM1_C	Phase #1 rail C PWM output. Refer to PWM4_A description.
39	PWRGD_C	Power Good indicator for rail C. This open-drain output requires an external pull-up resistor. PWRGD_C is pulled low when a shutdown fault occurs.
40	ISEN1P_C	Phase #1 current sense inputs of rail C. The ISEN1N_C and ISEN1P_C pins are used to differentially sense the corresponding channel current. Connect ISEN1P_C to VCC if rail C is not used.
41	ISEN1N_C	
42	VSEN_C	Positive differential voltage sense input for rail C. Connect to positive remote sensing point and should be routed with RGND_C as a differential pair.
43	RGND_C	Negative differential voltage sense input for rail C. Connect to negative remote sensing point.
44	COMP_C	Error amplifier output of rail C.
45	FB_C	Error amplifier voltage feedback of rail C.
46	TSEN_B	Rail B external temperature measurement input pin.
47	TSEN_C	Rail C external temperature measurement input pin.
48	VCC	Controller power supply. Connect this pin to 5V and place an RC filter, $R = 2.2\Omega$ and $C = 4.7\mu F$. The decoupling capacitor should be placed as close to PWM controller as possible. The recommended size of R _{VCC} is 0603.
49	VDDIO	Supply voltage input of SVI3 interface. This pin serves as the reference for SVC, SVD, SVTI and SVTO.
50	SVD	Serial VID Data input. This pin is a push-pull signal which transmits commands from the master to the slaves.
51	SVC	Serial VID Clock input. This pin is a push-pull signal which acts as a clock for SVD, SVTI and SVTO.
52	SVTI	Serial VID Telemetry input. This pin is driven by the next-furthest slave on the telemetry daisy-chain.

Pin No.	Pin Name	Pin Function
53	SVTO	Serial VID Telemetry output. This pin is a push-pull output.
54	IMON_B	Rail B VR current monitor output. This pin outputs a current proportional to the output current.
55	IMON_C	Rail C VR current monitor output. This pin outputs a current proportional to the output current.
56	VREF06	Fixed 0.6V output reference voltage. This voltage is used to offset the output voltage of all IMON pins. While controller shuts down or sets all rails in PSI6, voltage source shuts down. An exact 0.47 μ F decoupling capacitor and a 3.9 Ω resistor must be placed between this pin and GND.
57	IMON_A	A rail VR current monitor output. This pin outputs a current proportional to the output current.
58	CONFIG	NVM configuration selection pin to select the stored custom configurations. For soldering check, connect the CONFIG pin to 5V and pull the PWREN high. If the soldering is good, the output is 0.9V for rail A, 1V for rail B and 1.1V for rail C.
59	PWRGD_A	Power Good indicator for rail A. This open-drain output requires an external pull-up resistor. PWRGD_A is pulled low when a shutdown fault occurs.
60	TSEN_A	Rail A external temperature measurement input pin.
61 (Exposed Pad)	GND	Ground. The exposed pad must be soldered to a large PCB and connected to GND with enough via numbers for maximum power dissipation.

9 Functional Block Diagram

10 Absolute Maximum Ratings

(錯誤! 找不到參照來源。)

- VIN to GND ----- -0.3V to 28V
- VCC to GND ----- -0.3V to 6.5V
- RGND to GND----- -0.3V to 0.3V
- Other Pins ----- -0.3V to 6.8V
- Lead Temperature (Soldering, 10 sec.) ----- 260°C
- Junction Temperature ----- 150°C
- Storage Temperature Range ----- -65°C to 150°C

Note 1. Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

11 ESD Ratings

(錯誤! 找不到參照來源。)

- HBM (Human Body Model) ----- 2kV

Note 2. Devices are ESD sensitive. Handling precautions are recommended.

12 Recommended Operating Conditions

(錯誤! 找不到參照來源。)

- VIN to GND ----- 4.5V to 24V
- Supply Input Voltage, VCC----- 4.75V to 5.25V
- Junction Temperature Range----- -40°C to 125°C

Note 3. The device is not guaranteed to function outside its operating conditions.

13 Thermal Information

(錯誤! 找不到參照來源。)

- WQFN-60L 7x7, θ_{JA} ----- 25.5°C/W
- WQFN-60L 7x7, $\theta_{JC(Top)}$ ----- 12.9°C/W

Note 4. For more information about thermal parameters, see the Application and Definition of Thermal Resistances report, [AN061](#).

14 Electrical Characteristics

(V_{CC} = 5V, V_{VDDIO} = 1.8V, typical values are referenced to T_J = 25°C, Min. and Max. values are referenced to T_J from -10°C to 105°C, unless otherwise specified)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit	
Supply Input

17 Operation

17.1 G-NAVP™ Control Mode

The RT3674FE adopts G-NAVP™ (Green Native AVP), which is Richtek's proprietary topology. It is derived from current mode constant on-time control with finite DC gain of error amplifier and DC offset cancellation. The topology can achieve easy load-line design and provide high DC accuracy and fast transient response. When the sensed current signal reaches the sensed voltage signal, the RT3674FE generates a PWM pulse to achieve loop modulation. Figure 1 shows the basic G-NAVP™ behavior waveforms. The COMP signal is the sensed voltage inverted and amplified signal of the output voltage while current loading increases. The COMP rises due to output voltage droop. Then, rising COMP forces PWM to turn on earlier and closely. While inductor current reaches loading current, COMP enters another steady state of higher voltage and the corresponding output voltage is in the steady state of lower voltage. The load-line, output voltage drooping proportional to loading current, is achieved.

Figure 1. G-NAVP™ Behavior Waveform

17.2 SVI3 and I²C Interface/Control Logic/Configuration Registers

SVI3 Interface receives or transmits SVI3 signal from/to CPU/GPU. The I²C Interface receives or transmits I²C signal from/to SMBus. Control Logic executes command (Read/Write/Reset registers, VID/Address packets, Change Power State and Telemetry Request) and sends related signals to control VR. Configuration Registers include function setting registers and CPU/GPU required registers.

17.3 IMON Filter

IMON Filter is used to average current signal by an analog low-pass filter. It outputs IMON_AAVG, IMON_BAVG and IMON_CAVG to the MUX of ADC for current reporting.

17.4 MUX and ADC

The MUX supports the inputs for TSEN_A, TSEN_B, TSEN_C, PSYS, IMON_AAVG, IMON_BAVG and IMON_CAVG. The ADC converts these analog signals to digital codes for reporting or function settings.

17.5 UVLO

The UVLO detects the VCC voltage. As VCC exceeds threshold, controller issues POR = high and waits PWREN. After both POR and PWREN are ready, then controller is enabled.

17.6 Loop Control/Protection Logic

It controls power-on/off sequence, protections, power state transition and PWM sequence.

17.7 DAC

The DAC generates a reference VID voltage according to the VID code sent by Control Logic. According to VID packets command, Control Logic dynamically changes VID voltage to the target voltage with required slew rate.

17.8 ERROR AMP

The ERROR AMP inverts and amplifies the difference between output voltage and VID with externally set finite DC gain. The output signal is COMP for PWM trigger.

17.9 PER CSGM

The PER CSGM senses per-phase inductor current. The outputs are used for loop response, current balance, zero current detection, current reporting and overcurrent protection.

17.10 SUM CSGM

The SUM CSGM senses total inductor current with RIMON gain adjustment. SUM CSGM output current ratio can also be set by NVM. It helps wide application range of DCR and load-line. SUM CSGM output is used for PWM trigger.

17.11 RAMP

The RAMP helps loop stability and transient response.

17.12 PWM CMP

The PWM comparator compares COMP signal with sum current signal based on RAMP to trigger PWM.

17.13 Offset Cancellation

The offset cancellation is based on VID, COMP voltage and current signal from SUM CSGM to control output voltage accurately.

17.14 Current Balance

Per-phase current sense signal is compared with sensed average current. The comparison result adjusts each phase PWM width to optimize current and thermal balance.

17.15 Zero Current Detection

Detects whether each phase current crosses zero current. The result is used for DEM power saving and overshoot reduction (anti-overshoot function).

17.16 AQR/ANTIOVS

The AQR is a new generation of quick response mechanism (Adaptive Quick Response, AQR) which detects loading rising edge and allows all PWMs to turn on. The PWM pulse width triggered by AQR is adaptive to loading level. The AQR trigger level can be set by NVM. ANTIOVS can help overshoot reduction which detects loading falling edge and forces all PWMs in tri-state until the zero current is detected.

17.17 TONGEN/Driver Interface

The PWM comparator output signal triggers TONGEN to generate PWM pulse. The PWM sequence is controlled by Loop Control. The PWM pulse width is determined by frequency setting, current balance output and Adaptive Quick Response (AQR) settings. Once AQR is triggered, VR allows all PWM to turn on at the same time. Driver interface provides high/low/tri-state to drive external driver. In power saving mode, driver interface force PWM in tri-state to turn off high-side and low-side power MOSFETs according to zero current detection output. In addition, the PWM state is controlled by protection logic. Different protections force required PWM state.

17.18 OVP/UVP/OCP

Overvoltage protection/ undervoltage protection/ overcurrent protection.

18 Application Information

Richtek's component specification does not include the following information in the Application Information section. Thereby no warranty is given regarding its validity and accuracy. Customers should take responsibility to verify their own designs and reserve suitable design margin to ensure the functional suitability of their components and systems.

The RT3674FE includes three voltage rails: a 4/3/2/1 phase synchronous buck controller, the rail A ; a single phase synchronous buck controller, the rail B ; and single phase synchronous buck controller, the rail C.

The RT3674FE is designed to meet AMD SVI3 compatible CPUs specification. The controller builds-in non-volatile memory (NVM) and I²C interface to store customized configuration. The RT3674FE is ideal for notebook computers or desktop computers.

18.1 Power-ON Sequence

To ensure sufficient power supply for proper operation, the VR triggers UVLO if VCC voltage drops below 4.2V (max). UVLO protection shuts down the controller and forces high-side MOSFET and low-side MOSFET off. Figure 2 shows the typical timing of controller power-on. When $VCC > VCC_POR_NVM$, RT3674FE begins to download data to registers from NVM. When $VCC > VCC_POR$, RT3674FE starts initialization which includes internal circuit offset correction and function settings. The maximum time from VCC exceeds VCC_POR threshold to initialization done is 7.6ms. Accordingly, the TVCC-EN is recommended to be larger than 8ms. When initialization is done, the controller is in ultra-low power mode. It will ramp up to default voltage with default slew rate when PWREN is high. PWRGD is asserted within 5μs after the output voltage is within tolerance and start-up ramping is complete. Users can set multi-functions through NVM by I²C interface when initialization is done.

Driver power (PVCC) is strongly suggested to be ready after VCC. This can prevent current flowing back to VCC from PVCC through PWMx pin or DRVEN/DRVEN_F pin.

Figure 2. Typical Timing of Controller Power-ON

18.2 I²C Address Setting

The RT3674FE provide multiple I²C address to support multiple devices used in I²C interface. To properly set the I²C address (7-bit and 8-bit format), resistors with 1% tolerance must be connected from CONFIG pin to ground and resistor value described in Table 1.

Table 1. I²C Address (7-bit and 8-bit format) (HEX)

CONFIG		I ² C Address (7-bit)	I ² C Address (8-bit)
Max.	Min.		
325Ω	301Ω	20	40
975Ω	901Ω	21	42
1.625kΩ	1.501kΩ	22	44
2.275kΩ	2.101kΩ	23	46

18.3 Maximum Active Phases Number Setting

The number of active phases is determined by ISENxP voltages. The detection is only active and latched at initialization state. While voltage at ISENxP > (VCC – 0.5V), maximum active phase number is (x-1). For example, pulling ISEN4P_A to VCC programs a 3-phase operation, while pulling ISEN3P_A to VCC programs a 2-phase operation. The unused ISENxN pins are recommended to connect to VCC and the unused PWMx pins can be floating. Figure 3 is a 3-phase operation example. For smart power stage (SPS) application, the unused ISENxN pins must be floating.

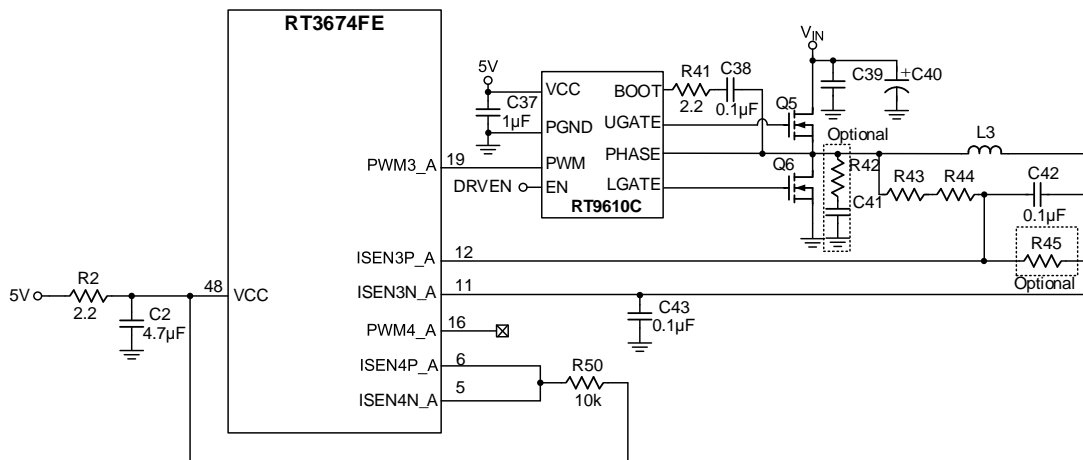

Figure 3. 3-Phases Operation Setting (For DCR Current Sense Application)

18.4 Rail Disable

Pulling ISEN1P_A to VCC disables A rail. The unused ISENxN_A pins are recommended to connect to VCC and the unused PWMx_A, VSEN_A, FB_A, COMP_A, IMON_A, TSEN_A, PWRGD_A and PWREN_A pins can be floating. Pulling ISEN1P_B to VCC disables B rail. The unused ISEN1N_B pin are recommended to connect to VCC and the unused PWM1_B, VSEN_B, FB_B, COMP_B, IMON_B, TSEN_B, PWRGD_B and PWREN_B pins can be floating. Pulling ISEN1P_C to VCC disables C rail. The unused ISEN1N_C pin are recommended to connect to VCC and the unused PWM1_C, VSEN_C, FB_C, COMP_C, IMON_C, TSEN_C, PWRGD_C and PWREN_C pins can be floating.

18.5 Acoustic Noise Suppression

The RT3674FE supports acoustic noise suppression function for reducing acoustic noise induced by piezoelectric effect from MLCC. As output voltage transition occurs, especially in dynamic VID, the vibrating MLCC produces acoustic noise if the vibrating frequency falls into audible band, and the noise level is related to the output voltage transition amplitude ΔV . Therefore, the RT3674FE adopts acoustic noise suppression function which is enabled by pulling ANS_EN pin to VCC to reduce ΔV when Negative VID transitions.

18.6 NVM Configuration Mechanism

The RT3674FE provides multiple parameters for platform setting and BOM optimization. These parameters can be set through NVM by I²C protocol interface. Richtek provides a Microsoft Excel-based design tool for user configuration and provide programing flow char for customer. All setting functions are summarized in Table 2. Table 3 shows the functions that cannot support on-line tuning.

Table 2. Summary of Setting Functions (Page 02) (Group 1)

18.7 Thermal Monitoring and Indicator

TSEN pin is available to process thermal monitoring by either NTC thermistor or temperature monitor of the smart power stage and it can be set by NVM.

When NTC thermistor is used as thermal monitoring, TSEN pin voltage = 80μA x (R1//RNTC+R2), defined as Thermal Voltage, the NTC thermistor network to sense temperature as shown in Figure 4. NTC thermistor is recommended to be placed near the MOSFET, the hottest area in the PCB.

The controller processes the TSEN pin voltage to report temperature telemetry. When the TSEN pin voltage is less than voltage of VRHOT_THRESH, the controller asserts the VR_HOT bit in the temperature telemetry packet to indicate thermal alert. The VRHOT_THRESH can be changed through SVI3 register.

Temperature Register data is updated every 700μs and the averaging interval is 5.6ms. The resistance accuracy of TSEN network is recommended to be less than 1% error. NTC thermistor is 100k/Beta = 4250 and accuracy is 1%.

When thermal monitoring is implemented by TMON of smart power stage (SPS), the NVM registers of TSEN need to select SPS temperature sensor and the TSEN pin operates as an input terminal to receive the TMON output from SPS. The RT3674FE offers the thermal register of 0.6 V at 0°C and 1.4 V at 100°C with 8 mV/°C typical slope.

$$\text{Temp. } (^{\circ}\text{C}) = \frac{V_{\text{TMON}} - 0.6\text{V}}{8\text{mV}/^{\circ}\text{C}}$$

Figure 4. Multi-Function Pin Setting Mechanism for TSEN

18.8 System Input Power Monitoring (PSYS)

The RT3674FE provides PSYS function to monitor total system power and report to the CPU via SVI3 interface. The PSYS function is illustrated in Figure 5. PSYS meter measures system input current and outputs a proportional current signal I_{PSYS} . R_{PSYS} is designed for the P_{SYS} voltage = 1.6V or 3.2V with maximum I_{PSYS} for 100% system input power. The full scale voltage of PSYS can be set by NVM. System power telemetry consists of a 10-bit encoding that is mapped to eight user-selectable scales. The user-selectable scales can be set by NVM. Pull PSYS pin to VCC can disable PSYS function.

Figure 5. PSYS Function Block Diagram

18.9 Zero Load-line

The RT3674FE also supports enable zero load-line function. When zero load-line function is enabled, the output voltage is determined only by VID and does not vary with the loading current like load-line system behavior. The RT3674FE adopts AC-droop to effectively suppress load transient ring-back and control overshoot for zero load-line application. Figure 6 shows the condition without AC-droop control. The output voltage without AC-droop control has extra ring-back ΔV_2 due to C area charge. Figure 7 shows the condition with AC-droop control. While loading occurs, the controller changes VID target to short-term voltage target temporarily. Short-term voltage target is related to transient loading current ΔI_{CC} and can be represented as the following:

$$\text{Short_Term_Voltage_Target} = \text{VID} - \Delta I_{CC} \times R_{LL}$$

The way to set R_{LL} is the same as load-line system. The short-term voltage target reverts to VID target slowly after a period of time. The short-term voltage target can help inductor current not to exceed loading current too much and then the ring-back ΔV_2 can be suppressed. The overshoot amplitude is reduced to only ΔV_3 .

Figure 6. Zero Load-line without AC-droop Control

Figure 7. Zero Load-line with AC-droop Control

18.10 Rail A VR

18.11 Current Sense

RT3674FE supports two different current sense mechanisms, one is DCR current sensing and the other is Smart Power Stage (SPS) current sensing.

18.12 DCR Current Sense

To achieve higher efficiency, the RT3674FE adopts inductor DCR current sensing to get each phase current signal, as illustrated in Figure 8. An external low-pass filter R_{X1} and C_X reconstruct the current signal. The low-pass filter time constant $R_{X1} \times C_X$ should match time constant $\frac{L}{DCR}$ of inductance and DCR. It is necessary to fine tune R_{X1} and C_X for transient performance and current telemetry. If RC network time constant matched inductor time constant, an ideal load transient waveform can be designed. If RC network time constant is larger than inductor time constant $\frac{L}{DCR}$, VSEN waveform has a sluggish droop during load transient. If RC network is smaller than inductor time constant $\frac{L}{DCR}$, VSEN waveform sags to create an undershooting to fail the specification and mis-trigger overcurrent protections (sum OCP). Figure 9 shows the output waveforms according to the RC network time constant. The R_{X1} is highly recommended as two 0603 size resistors in series to enhance the output current telemetry accuracy. The C_X is suggested to be 0.1 μF X7R/0603 for low de-rating value at high frequency.

$$I_{CS,PERx} = \frac{V_{CSIN}}{R_{CS}} = \frac{I_L \times DCR}{R_{CS}}$$

The R_{X2} is optional to prevent V_{CSIN} exceeding current sense amplifier input range. The time constant of $(R_{X1}/R_{X2}) \times C_X$ should match $\frac{L}{DCR}$.

$$I_{CS,PERx} = \frac{V_{CSIN}}{R_{CS}} = \frac{I_L \times DCR}{R_{CS}} \times \frac{R_{X2}}{R_{X1} + R_{X2}}$$

The current signal $I_{CS,PERx}$ is mirrored for load-line control/current reporting, current balance and zero current. The mirrored current to $IMONx$ pin is 1.25 time of $I_{CS,PER}$

$$I_{MONx} = A_{MIRROR} \times I_{CS,PERx}, \quad A_{MIRROR} = 1.25$$

The current sense lines must be routed as differential pair from the inductor to the controller on the same layer.

Figure 8. Inductor DCR Current Sensing Method

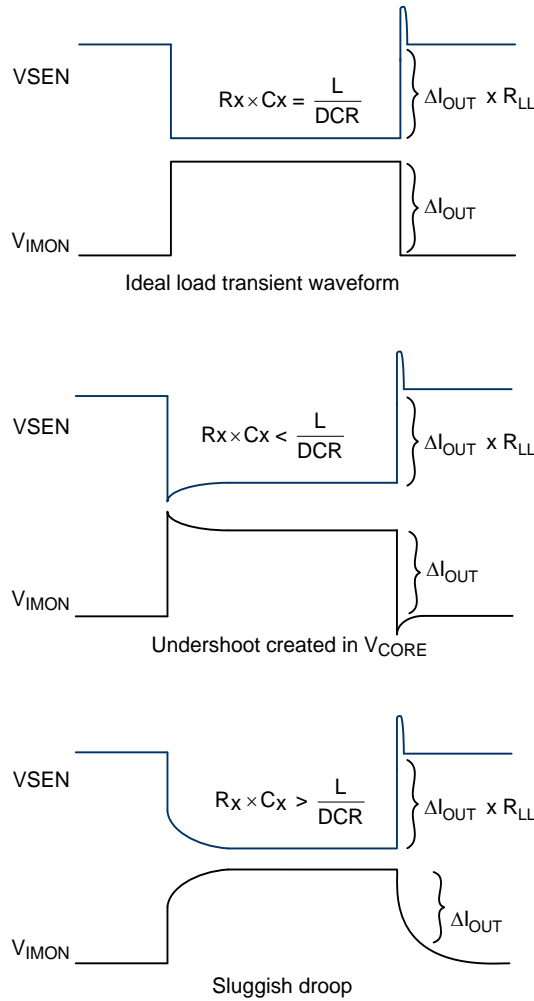

Figure 9. All Kinds of RC Network Time Constant

To compensate DCR positive temperature coefficient, conventional current sense method needs an NTC resistor for per phase current loop. The RT3674FE adopts a patented total current sense method that requires only one NTC resistor for thermal compensation. The NTC resistor is designed within IMON resistor network on IMON pin. It is suggested to be placed near the inductor of the first phase.

All phase current signals are gathered to IMON pin and converted to a voltage signal V_{IMON_A} by $R_{IMON, EQ}$ based on V_{REF} pin. The V_{REF} pin provides 0.6V voltage source (as presented as V_{VREF}) during normal operation. The relationship between V_{IMON_A} and inductor current I_{Lx} is:

$$V_{IMON_A} - V_{VREF} = (I_{L1} + I_{L2} + I_{L3} + I_{L4}) \times \frac{DCR}{1K\Omega} \times A_{MIRROR} \times R_{IMON, EQ}$$

$V_{IMON_A} - V_{VREF}$ is proportional to output current. $V_{IMON_A} - V_{VREF}$ is used for output current telemetry and load-line loop-control and sum overcurrent protection. For the telemetry, $V_{IMON_A} - V_{VREF}$ is averaged by analog low-pass filter and then coded by 10-bit ADC and mapped to user selectable $I_{OUT_SCALE_A}$. The $I_{OUT_SCALE_A}$ can be set by NVM. The $R_{IMON, EQ}$ should be designed according to Max. current of $I_{OUT_SCALE_A}$ value, that is $V_{IMON_A} - V_{VREF} = 0.4V$ while $(I_{L1} + I_{L2} + I_{L3} + I_{L4}) = \text{Max. current of } I_{OUT_SCALE_A}$. The maximum current sense gain error by controller is $\pm 2\%$.

For load-line loop control, $V_{IMON_A} - V_{VREF}$ is scaled by A_i , and it can be selected by register A_i_A . The detailed application is described in the Load-line Setting section.

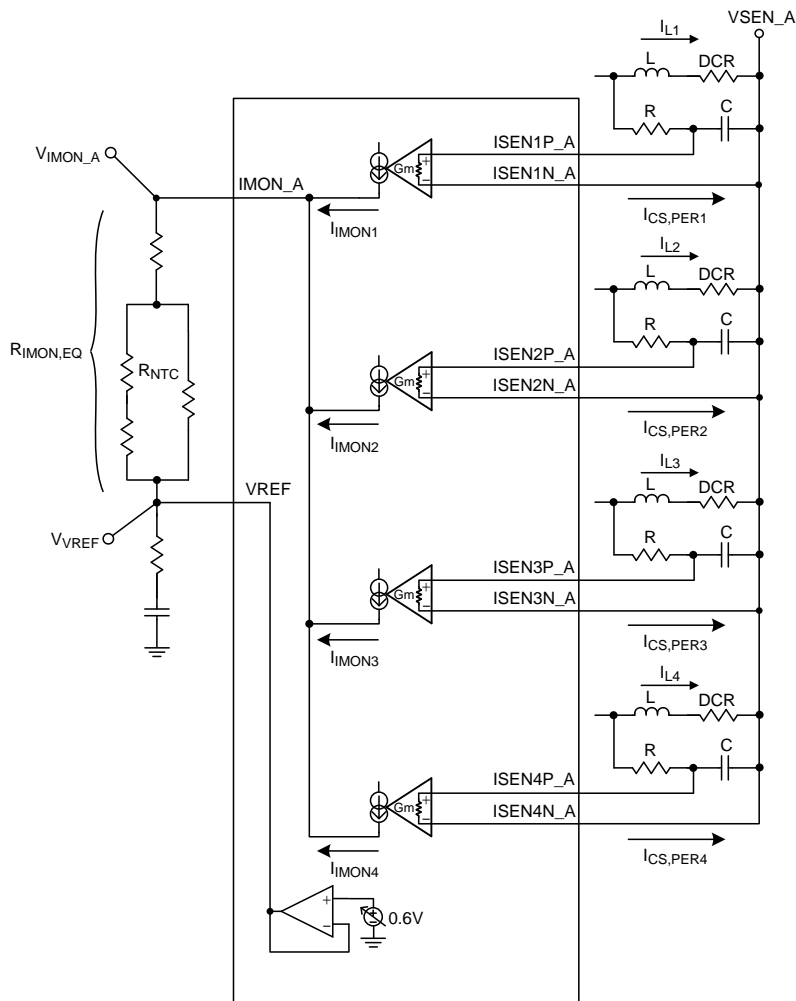

Figure 10. Total DCR Current Sense Method

18.13 Smart Power Stage (SPS) Current Sense

As SPS current sense is used, the register of EN_SPS_A needs to be enabled and ISEN1N_A operates as the output terminals which offer the reference voltage of 1.3V for the reference inputs of SPS. The ISENxN_A of each phase is connected by internal and a capacitor of 0.22μF to 1μF is suggested to be connected between ISEN1N_A to GND. Figure 11 shows the implementation of SPS current sensing report. The V_{IMON} and current reporting from SPS can be calculated as:

$$V_{IMON_A} - V_{VREF} = (I_{OUT_SPS1} + I_{OUT_SPS2} + I_{OUT_SPS3} + I_{OUT_SPS4}) \times \frac{R_{SENSE}}{1K\Omega} \times A_{MIRROR} \times R_{IMON,EQ}$$

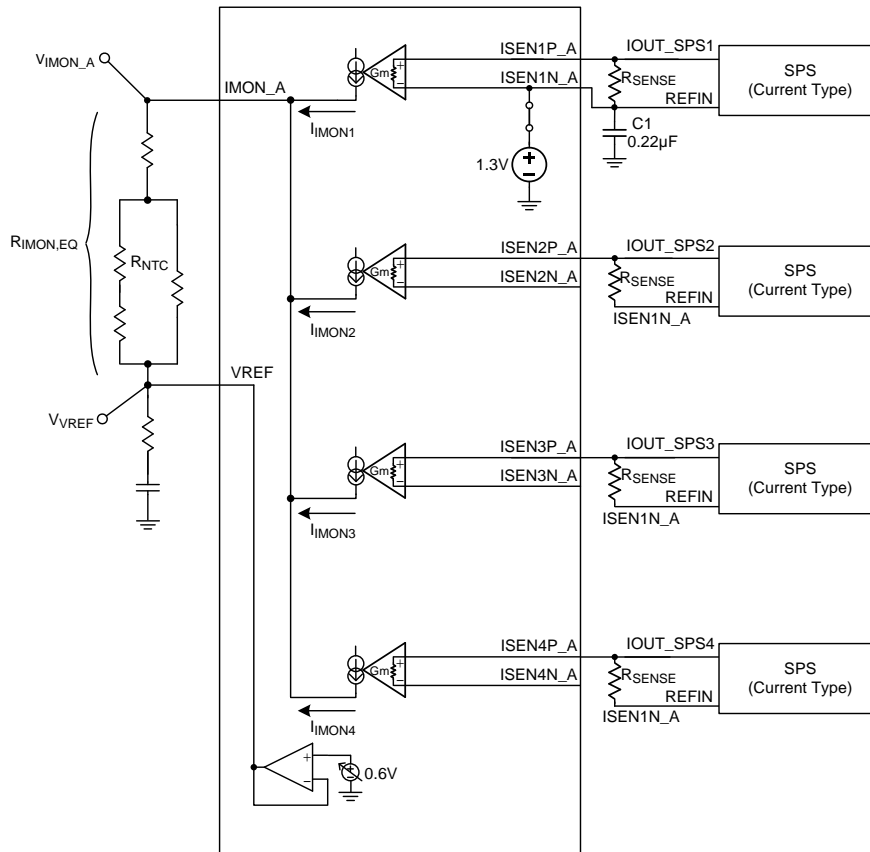

Figure 11. SPS Current Sense

18.14 Load-line Setting (RLL)

An output voltage load-line (Adaptive Voltage Positioning) is specified in CPU VR for power saving and output capacitance reduction. The characteristic of load-line is that the output voltage decreases by an amount proportional to the increasing loading current. The slope between output voltage and loading current (RLL) is shown in Figure 12. Figure 13 shows the voltage and current loop circuits of the RT3674FE for the load-line control. The detailed equation is described as below:

$$R_{LL} = \frac{\text{Current Loop Gain}}{\text{Voltage Loop Gain}} = \frac{DCR}{1K\Omega} \times A_{MIRROR} \times R_{IMON,EQ} \times \frac{A_i}{\frac{R_{EA2}}{R_{EA1}}} \times 3$$

, where A_i is current gain and $\frac{R_{EA2}}{R_{EA1}}$ is ERROR AMP

gain and suggested as 2~4.5 for better transient response. RLL can be programmed by A_i and $\frac{R_{EA2}}{R_{EA1}}$. A_i can be selected by the registers of $A_i_A[2:0]$, which is listed in Table 4.

18.15 Voltage-on- the Fly(VOTF) Compensation

During VOTF transition, an extra current is required to charge output capacitors for increasing voltage. The charging current approximates to the product of the VOTF slew rate and output capacitance. For droop system, the extra charging current induces extra voltage droop so that the output voltage cannot reach the target within the specified time. The extra voltage drop approximates to VOTF Slew Rate x Output Capacitance x R_{LL} (R_{LL} is the load-line slope, mΩ). This phenomenon is called droop effect. How charging current affects loop is illustrated in Figure 14. The RT3674FE provides one VOTF compensation function as shown in Figure 15. An internal current I_{VOTF_LIFT} sinks internally from FB pin to generate VOTF compensation, I_{DVID_LIFT} × R_{EA1}. I_{VOTF_LIFT} for fast VOTF SR can be set from registers of VOTF_LIFT_TH_A. For different scales of VOTF SR, I_{VOTF_LIFT} is internally adjusted.

Compensating magnitude can also be adjusted by R_{EA1}. When DAC output reaches the target, inductor current is still high and needs a time to settle down to the DC loading current. In the settling time, the falling down current keeps charging output capacitor (The magnitude is related with inductor, capacitance and VID). Thus, VOTF compensation can be less than VOTF Slew Rate x Output Capacitance (capacitance deration should be considered). If output capacitance is so large that VOTF compensation cannot cover, adding a resistor and capacitor from FB to GND can also provide similar function. The ERROR AMP compensation (resistance and capacitance network among VSEN, FB and COMP) also affects VOTF behavior. The final setting should be based on actual measurement.

Figure 14. Droop Effect in VID Transition

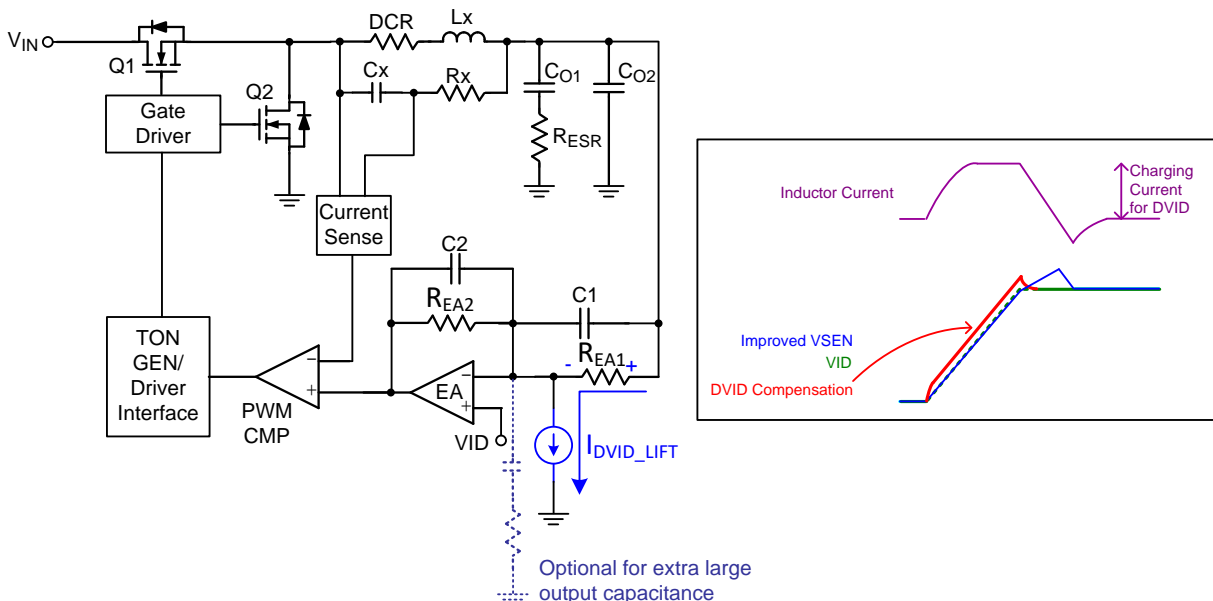

Figure 15. VOTF Compensation

18.16 Compensator Design

The compensator of the RT3674FE does not need a complex type III compensator to optimize control loop performance. It can adopt a simple type II compensator (one pole, one zero) in the G-NAVP™ topology to fine tune ACLL performance. The one pole and one zero compensator is shown in Figure 16. For SVI3 transient specification, it is recommended to adjust compensator according to load transient ring-back level. Refer to the design tool for default compensator values.

Figure 16. Type II Compensator

18.17 Differential Remote Sense Setting

The VR provides differential remote-sense inputs to eliminate the effects of voltage drops along the PC board traces, CPU internal power routes and socket contacts. The CPU contains on-die sense pins, VSENSE and VSS_SENSE. The related connection is shown in Figure 17. The VID voltage (DAC) is referenced to RGND to provide accurate voltage at remote CPU side. While CPU is not mounted on the system, two resistors of typical 100Ω are required to provide output voltage feedback.

Figure 17. Remote Sensing Circuit

18.18 Switching Frequency Setting

The G-NAVP™ (Green Native AVP) topology is one kind of current-mode constant on-time control. It generates an adaptive TON (PWM) with input voltage (VIN) for better line regulation. The TON is also adaptive to VID voltage to achieve constant frequency. The constant switching frequency operation makes the thermal estimation easy. The RT3674FE provides a parameter setting of KTON to design TON width. KTON is set by NVM register of KTON_A. The related setting table is listed in

Table 5

The equations of TON are listed as below:

VID > 0.9V,

$$T_{on} = 2\mu s \times \frac{VID}{K_{TON} \cdot (VIN)}$$

VID ≤ 0.9V,

$$T_{on} = 2\mu s \times \frac{0.9}{K_{TON} \cdot (VIN)}$$

Table 5. Setting of KTON_A[4:0]

KTON_A[4]	KTON
0	KTON = 0.5 + [3:0] x 0.1
1	KTON = 1.2 + [3:0] x 0.1

The switching frequency can be derived from T_{ON} as shown below. The losses in the power stage and driver characteristics are considered.

$$\text{Freq} = \frac{\text{VID} + \frac{I_{CC}}{N} \times (\text{DCR} + \frac{R_{ONLS,max}}{n_{LS}} - N \times R_{LL})}{\left[V_{IN} + \frac{I_{CC}}{N} \times \left(\frac{R_{ONLS,max}}{n_{LS}} - \frac{R_{ONHS,max}}{n_{HS}} \right) \right] \times (T_{ON} - T_D + T_{ON,VAR}) + \frac{I_{CC}}{N} \times \frac{R_{ONLS,max}}{n_{LS}} \times T_D}$$

VID: VID voltage

V_{IN}: input voltage

I_{CC}: loading current

N: total phase number

R_{ONHS,max}: maximum equivalent high-side R_{DS(ON)}

n_{HS}: number of high-side MOSFETs

R_{ONLS,max}: maximum equivalent low-side R_{DS(ON)}

n_{LS}: number of low-side MOSFETs.

T_D: summation of the high-side MOSFET delay time and rising time

T_{ON,VAR}: on-time variation value

DCR: inductor DCR

R_{LL}: load-line setting (Ω)

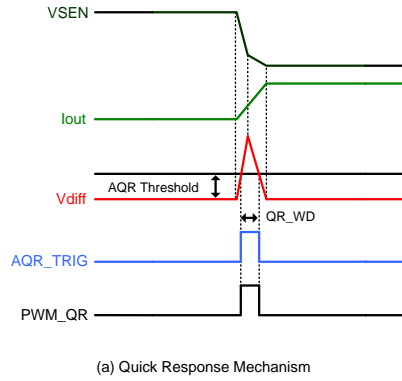

18.19 Adaptive Quick Response (AQR) and Fixed Quick Response (Fixed QR)

The RT3674FE adopts Adaptive Quick Response (AQR) and Fixed Quick Response (Fixed QR) to optimize transient response. Figure 18 shows the mechanism for AQR and Fixed QR. Under AQR mechanism, the controller detects output voltage drop slew rate. When the slew rate exceeds the AQR trigger threshold, all PWMs turn on until output voltage slew rate significantly slows down. AQR PWM width is adaptive to variable loading step. Under Fixed QR mechanism, the controller detects output voltage drop slew rate. While the slew rate exceeds the AQR trigger threshold, all PMWs turn on and PWM width can be selected through NVM registers of QR_WD_A in multi-phase operation and QR_WD_1PH_A in single-phase operation.

The AQR trigger threshold can be selected through NVM registers of AQR_TH_A in multi-phase operation and AQR_TH_1PH_A in single-phase operation.

The following equation can initially decide the AQR and Fixed QR starting trigger threshold. Note that the threshold should be larger than steady-state output voltage ripple falling slew rate and also the overshoot falling slew rate to avoid mis-triggering.

$$\text{Starting Trigger Threshold} = -4\mu \times \frac{dV_{SEN}}{dt}$$

(a) Quick Response Mechanism

(b) Quick Response Block Diagram

Figure 18. Adaptive Quick Response and Fixed Quick Response Mechanism

18.20 Anti-overshoot (ANTI-OVS)

The RT3674FE provides anti-overshoot function to suppress output voltage overshoot. The controller detects overshoot by signals related to output voltage. The overshoot trigger level can be adjusted by NVM register of ANTIOVS_TH_A. The main detecting signal comes from COMP. However, COMP characteristic varies with compensation. Initial trigger level setting is based on the following equation:

$$\Delta\text{COMP} \times \frac{4}{3} = \Delta\text{VSEN} \times \frac{R_{EA2}}{R_{EA1}} \times \frac{4}{3} > \text{Anti-OVS threshold}$$

The final setting should be determined according to actual Error AMP compensator design and measurement.

When overshoot exceeds the set trigger level, all PWMs keep in tri-state until the zero current is detected or VSEN returns to normal level. Turning off LGs forces positive current flow through body diode to cause diode forward voltage drop. The extra forward voltage can speed up inductor current discharge and decrease overshoot.

18.21 ACLL Performance Enhancement

The RT3674FE provides undershoot suppression function to improve undershoot by applying a positive offset at loading edge. The controller detects the COMP signal and compares it with steady state. When VCOMP variation exceeds a threshold, an additional positive offset is added to the output voltage. The undershoot suppression threshold can be selected through NVM register of AR_TH_1PH_A.

The smaller index indicates that the detection is triggered easily. Figure 19 shows undershoot suppression behavior in single phase. For different platforms, the optimized settings are different. The final setting must be based on the actual measurement.

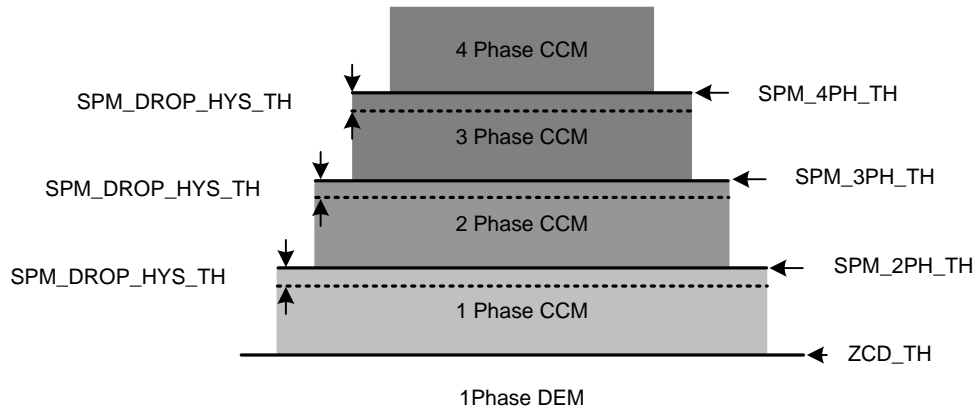

Figure 19. Undershoot Suppression Behavior in Single Phase

18.22 Smart Phase Management (SPM)

Automated phase shedding function is required in SVI3 protocol. The RT3674FE provides smart phase management to meet the spec and improve light load efficiency. When CPU sends PSI7 command to the VR, the VR will enter SPM mode. It can always enable and disable through I2C register (FORCE_PSI7 and IGNORE_PSI7). The SVI3 Register PSI state follows SVI3 command and ACK PSI change command when force/ignore PSI7. The IMON pin voltage (V_{IMON}) represents the total current. The controller compares V_{IMON} with SPM_2PH_TH, SPM_3PH_TH and SPM_4PH_TH to decide the number of operating phase. There is no delay during up phase. The hysteresis (SPM_DROP_HYS_TH) and delay time exist during a down phase decision. When V_{IMON} is lower than (SPM_2PH_TH-SPM_DROP_HYS_TH), (SPM_3PH_TH-SPM_DROP_HYS_TH) or (SPM_4PH_TH-SPM_DROP_HYS_TH), the controller goes to lower phase number operation and automatically enters to diode emulation mode (DEM) when the inductor current is lower than zero current detector threshold. In addition to the output current comparison, the RT3674FE provides four events to operate in full phase immediately. One is VOTF up, another is VOTF down without enabling decay mode, another is triggering the AQR/Fixed QR function and the other is enabling Force_PSI0 through the I2C register. Figure 20 shows smart phase management mechanism.

Figure 20. Smart Phase Management Mechanism

18.23 Rail B/C VR

18.24 Current Sense

RT3674FE supports two different current sense mechanisms, one is DCR current sensing and the other is Smart Power Stage (SPS) current sensing.

18.25 DCR Current Sense

To achieve higher efficiency, the RT3674FE adopts inductor DCR current sensing to get per-phase current signal, as illustrated in Figure 21. An external low-pass filter (R_{X1}/R_{EQ}) and C_X reconstruct the current signal. The low-pass filter time constant $(R_{X1}/R_{EQ}) \times C_X$ should match time constant $\frac{L}{DCR}$ of inductance and DCR. it is necessary to fine tune (R_{X1}/R_{EQ}) and C_X for transient performance and current telemetry. If RC network time constant matched inductor time constant, an ideal load transient waveform can be designed. If RC network time constant is larger than inductor time constant $\frac{L}{DCR}$, VSEN waveform has a sluggish droop during load transient. If RC network is smaller than inductor time constant $\frac{L}{DCR}$, VSEN waveform sags to create an undershooting to fail the specification and mis-trigger overcurrent protections (sum OCP). Figure 22 shows the output waveforms according to the RC network time constant. The R_{X1} is highly recommended as two 0603 size resistors in series to enhance the output current telemetry accuracy. The C_X is suggested to be $0.1\mu F$ X7R/0603 for low de-rating value at high frequency.

$$I_{CS,PER} = \frac{V_{CSIN}}{R_{CS.}} = \frac{I_L \times DCR}{R_{CS.}} \times \frac{R_{EQ}}{R_{X1} + R_{EQ}}$$

The current signal $I_{CS,PER}$ is mirrored for load-line control/current reporting and zero current. The mirrored current to IMON_X pin is 1.25 time of $I_{CS,PER}$

$$I_{IMON_X} = A_{MIRROR} \times I_{CS,PER}, A_{MIRROR} = 1.25$$

The current sense lines must be routed as differential pair from the inductor to the controller on the same layer.

Figure 21. Inductor DCR Current Sensing Method

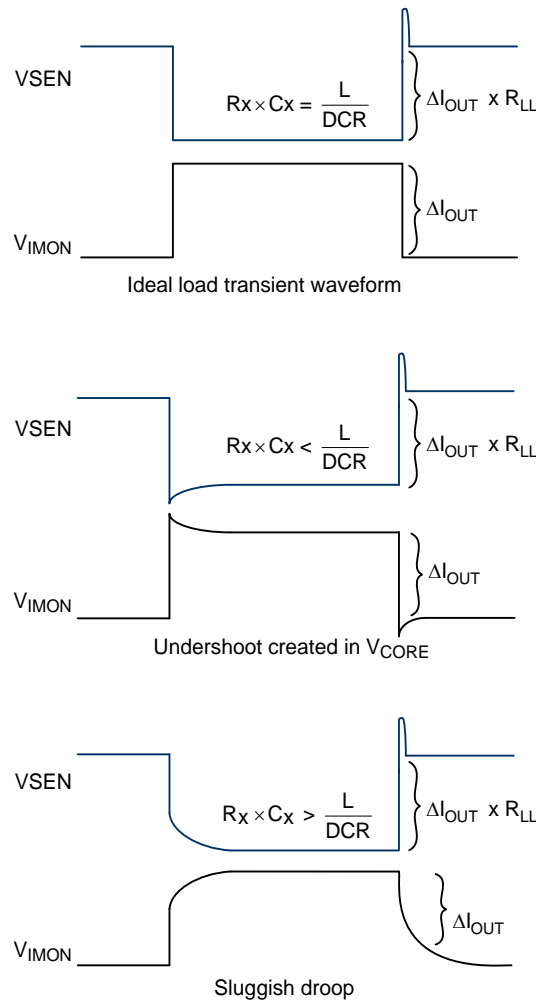

Figure 22. All Kinds of RC Network Time Constant

To compensate DCR positive temperature coefficient, conventional current sense method needs an NTC resistor for per phase current loop. The NTC resistor is designed within DCR current sense network. It is suggested to be placed near the inductor of the first phase.

The current signal are gathered to IMON_X pin and converted to a voltage signal VIMON_X by RIMON_X based on VREF pin. The VREF pin provides 0.6V voltage source (as presented as VVREF) during normal operation. The relationship between VIMON_X and inductor current I_L is:

$$V_{IMON_X} - V_{VREF} = I_L \times \frac{DCR}{1K\Omega} \times \frac{R_{EQ}}{R_{X1} + R_{EQ}} \times A_{MIRROR} \times R_{IMON_X}$$

V_{IMON_X} – V_{VREF} is proportional to output current. V_{IMON_X} – V_{VREF} is used for output current telemetry and load-line loop-control and sum overcurrent protection. For the telemetry, V_{IMON_X} – V_{VREF} is averaged by analog low-pass filter and then coded by 10-bit ADC and mapped to user selectable I_OUT_SCALE_B and I_OUT_SCALE_C for Rail B and Rail C respectively. The I_OUT_SCALE_B and I_OUT_SCALE_C can be set by NVM.

The R_{IMON_X} should be designed according to Max. current of I_OUT_SCALE value, that is V_{IMON_X} – V_{VREF} = 0.4V while I_L = Max. current of I_OUT_SCALE. The maximum current sense gain error by controller is ±2%.

For load-line loop control, V_{IMON_X} – V_{VREF} is scaled by A_i, and it can be selected by registers of A_{i_B} and A_{i_C} for Rail B and Rail C respectively. The detailed application is described in the Load-line Setting section.

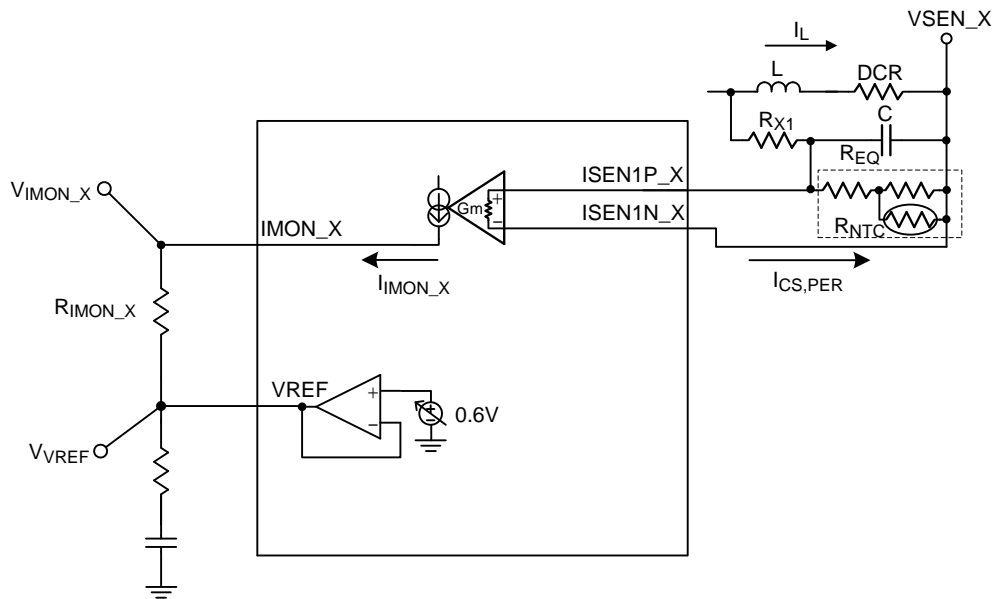

Figure 23. Total DCR Current Sense Method

18.26 Smart Power Stage (SPS) Current Sense

As SPS current sense is used, the registers of EN_SPS_B and EN_SPS_C need to be enabled for Rail B and Rail C respectively and ISEN1N operates as the output terminals which offer the reference voltage of 1.3V for the reference inputs of SPS. A capacitor of 0.22μF to 1μF is suggested to be connected between ISEN1N to GND. Figure 24 shows the implementation of SPS current sensing report. The VIMON_X and current reporting from SPS can be calculated as:

$$V_{IMON_X} - V_{VREF} = I_{OUT_SPS} \times \frac{R_{SENSE}}{1K\Omega} \times A_{MIRROR} \times R_{IMON_X}$$

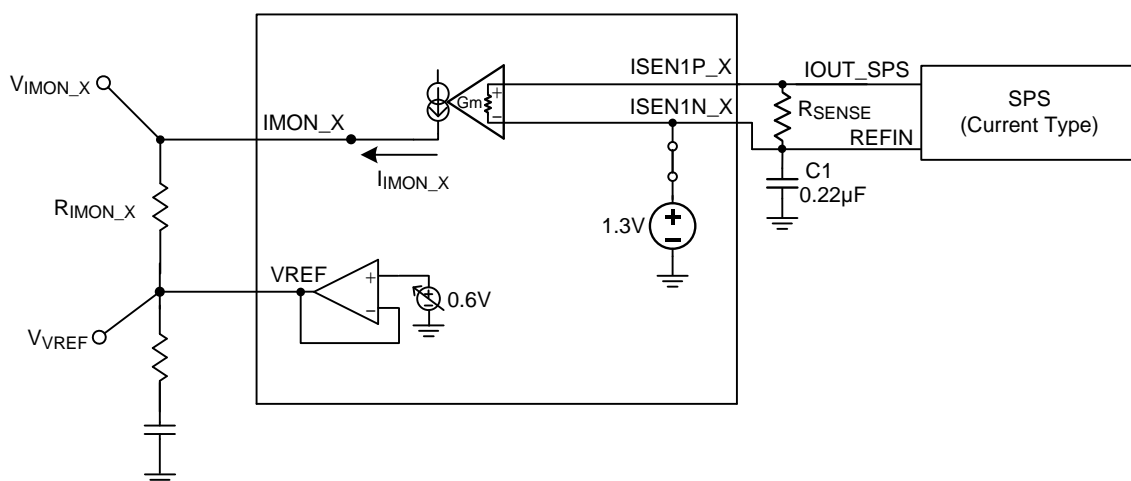

Figure 24. SPS Current Sense

18.27 Load-line Setting (RLL)

An output voltage load-line (Adaptive Voltage Positioning) is specified in CPU VR for power saving and output capacitance reduction. The characteristic of load-line is that the output voltage decreases by an amount proportional to the increasing loading current. The slope between output voltage and loading current (RLL) is shown in Figure 25. Figure 26 shows the voltage and current loop circuits of the RT3674FE for the load-line control. The detailed equation is described as below:

$$R_{LL} = \frac{\text{Current Loop Gain}}{\text{Voltage Loop Gain}} = \frac{DCR}{1K\Omega} \times \frac{R_{EQ}}{R_{X1} + R_{EQ}} \times \frac{20k}{AEAGM} \times \frac{A_i}{\frac{R_{EA2}}{R_{EA1}}}$$

, where A_i is current gain, AEAGM is error amp GM ratio and $\frac{R_{EA2}}{R_{EA1}}$ is ERROR AMP gain and suggested 1~4 for better transient response. RLL can be programmed by A_i , AEAGM and $\frac{R_{EA2}}{R_{EA1}}$. A_i can be selected by the registers of $Ai_B[6:4]$ and $Ai_C[6:4]$, which is listed in Table 6. AEAGM can be selected by the registers of $AEAGM_B[4]$ and $AEAGM_C[4]$, which is listed in Table 7.

18.28 Voltage-on- the Fly(VOTF) Compensation

During VOTF transition, an extra current is required to charge output capacitors for increasing voltage. The charging current approximates to the product of the VOTF slew rate and output capacitance. For droop system, the extra charging current induces extra voltage droop so that the output voltage cannot reach the target within the specified time. The extra voltage drop approximates to VOTF Slew Rate x Output Capacitance x RLL (RLL is the load-line slope, mΩ). This phenomenon is called droop effect. How charging current affects loop is illustrated in Figure 27. The RT3674FE provides one VOTF compensation function as shown in Figure 28. An internal current IVOTF_LIFT sinks internally from FB pin to generate VOTF compensation, $I_{DVID_LIFT} \times R_{EA1}$. IVOTF_LIFT for fast VOTF SR can be set from registers of VOTF_LIFT_TH_B/C. For different scales of VOTF SR, IVOTF_LIFT is internally adjusted.

Compensating magnitude can also be adjusted by R_{EA1} . When DAC output reaches the target, inductor current is still high and needs a period of time to settle down to the DC loading current. In the settling time, the falling down current keeps charging output capacitor (The magnitude is related with inductor, capacitance and VID). Thus, VOTF compensation can be less than VOTF Slew Rate x Output Capacitance (capacitance deration should be considered). If output capacitance is so large that VOTF compensation cannot cover, adding a resistor and capacitor from FB to GND can also provide similar function. The ERROR AMP compensation (resistance and capacitance network among VSEN, FB and COMP) also affects VOTF behavior. The final setting should be based on actual measurement.

Figure 27. Droop Effect in VID Transition

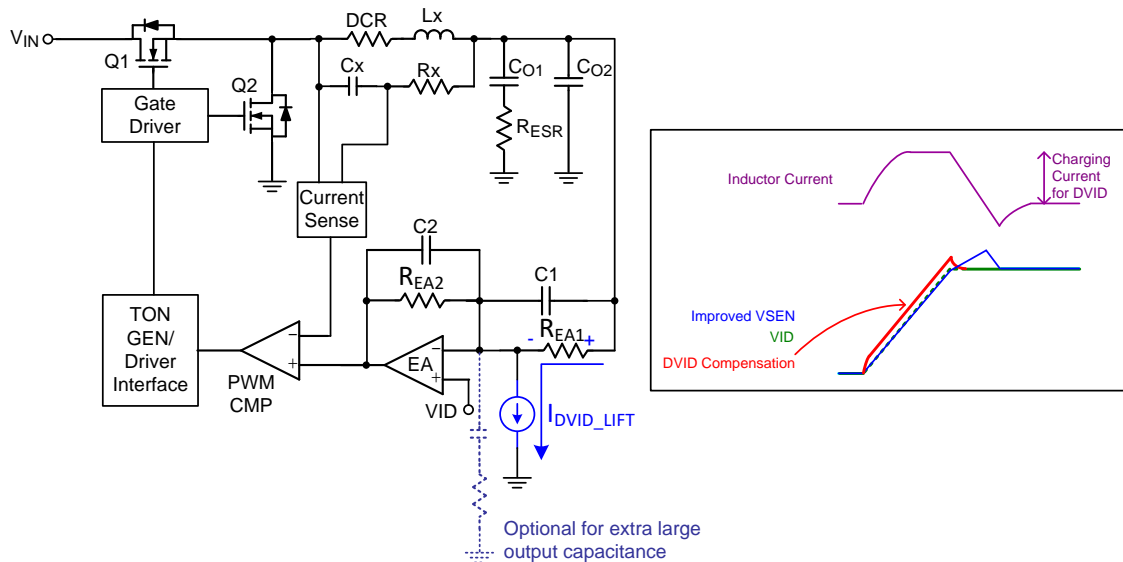

Figure 28. VOTF Compensation

18.29 Compensator Design

The compensator of the RT3674FE does not need a complex type III compensator to optimize control loop performance. It can adopt a simple type II compensator (one pole, one zero) in the G-NAVP™ topology to fine tune ACLL performance. The one pole and one zero compensator is shown in Figure 29. For SVI3 transient specification, it is recommended to adjust compensator according to load transient ring-back level. Refer to the design tool for default compensator values.

Figure 29. Type II Compensator

18.30 Differential Remote Sense Setting

The VR provides differential remote-sense inputs to eliminate the effects of voltage drops along the PC board traces, CPU internal power routes and socket contacts. The CPU contains on-die sense pins, VSENSE and VSS_SENSE. The related connection is shown in Figure 30. The VID voltage (DAC) is referenced to RGND to provide accurate voltage at remote CPU side. While CPU is not mounted on the system, two resistors of typical 100Ω are required to provide output voltage feedback.

Figure 30. Remote Sensing Circuit

18.31 Switching Frequency Setting

The G-NAVP™ (Green Native AVP) topology is one kind of current-mode constant on-time control. It generates an adaptive TON (PWM) with input voltage (VIN) for better line regulation. The TON is also adaptive to VID voltage to achieve constant frequency concept. The constant switching frequency operation makes the thermal estimation easy. The RT3674FE provides a parameter setting of KTON to design TON width. KTON is set by NVM register of KTON_B and KTON_C for rail B and C correspondingly. The related setting table is listed in Table 8.

The equations of TON are listed as below:

$$VID \geq 0.9V,$$

$$T_{on} = 2.206\mu \times \frac{VID}{K_{TON} \cdot (VIN - 0.9)} + 15ns$$

$$0.3V < VID < 0.9V,$$

$$T_{on} = 1.9854\mu \times \frac{1}{K_{TON} \cdot (VIN - VID)} + 15ns$$

$$VID \leq 0.3V,$$

$$T_{on} = 1.9854\mu \times \frac{1}{K_{TON} \cdot (VIN - 0.3)} + 15ns$$

Table 8. Setting of KTON_B[3:0] and KTON_C[3:0]

KTON_B[3:0] KTON_C[3:0]	KTON
0000	0.73
0001	0.82
0010	0.91
0011	1.00

The switching frequency can be derived from T_{ON} as shown below. The losses in the power stage and driver characteristics are considered.

$$Freq = \frac{VID + \frac{I_{CC}}{N} \times (DCR + \frac{R_{ONLS,max}}{n_{LS}} - N \times R_{LL})}{\left[V_{IN} + \frac{I_{CC}}{N} \times \left(\frac{R_{ONLS,max}}{n_{LS}} - \frac{R_{ONHS,max}}{n_{HS}} \right) \right] \times (T_{ON} - T_D + T_{ON,VAR}) + \frac{I_{CC}}{N} \times \frac{R_{ONLS,max}}{n_{LS}} \times T_D}$$

VID: VID voltage

VIN: input voltage

I_{CC} : loading current

N: total phase number

$R_{ONHS,max}$: maximum equivalent high-side $R_{DS(ON)}$

n_{HS} : number of high-side MOSFETs

$R_{ONLS,max}$: maximum equivalent low-side $R_{DS(ON)}$

n_{LS} : number of low-side MOSFETs.

T_D : summation of the high-side MOSFET delay time and rising time

$T_{ON,VAR}$: on-time variation value

DCR: inductor DCR

R_{LL} : load-line setting (Ω)

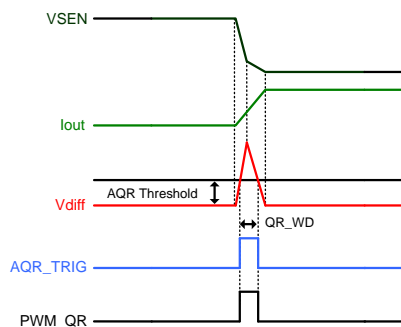

18.32 Adaptive Quick Response (AQR)

The RT3674FE adopts Adaptive Quick Response (AQR) to optimize transient response. Figure 31 shows the mechanism concept for AQR and Fixed QR. Under AQR mechanism, the controller detects output voltage drop slew rate. When the slew rate exceeds the AQR trigger threshold, all PWMs turn on until output voltage slew rate significantly slows down. AQR PWM width is adaptive to variable loading step. Under Fixed QR mechanism, the controller detects output voltage drop slew rate. While the slew rate exceeds the AQR trigger threshold, all PMWs turn on and PWM width can be selected through NVM registers of QR_WD_B and QR_WD_C.

The AQR trigger threshold can be selected through NVM registers of AQR_TH_B and AQR_TH_C.

The following equation can initially decide the AQR and Fixed QR starting trigger threshold. Note that the threshold should be larger than steady-state output voltage ripple falling slew rate and also the overshoot falling slew rate to avoid miss trigger.

$$\text{Starting Trigger Threshold} = -4\mu \times \frac{dV_{SEN}}{dt}$$

(a) Quick Response Mechanism

(b) Quick Response Block Diagram

Figure 31. Adaptive Quick Response and Fixed Quick Response Mechanism

18.33 Anti-overshoot (ANTI-OVS)

The RT3674FE provides anti-overshoot function to suppress output voltage overshoot. The controller detects overshoot by signals related to output voltage. The overshoot trigger level can be adjusted by NVM register of ANTIOVS_TH_B and ANTIOVS_TH_C. The main detecting signal comes from COMP. However, COMP characteristic varies with compensation. Initial trigger level setting is based on the following equation:

$$\Delta \text{COMP} \times \frac{4}{3} = \Delta V_{SEN} \times \frac{R_{EA2}}{R_{EA1}} \times \frac{4}{3} > \text{Anti-OVS threshold}$$

The final setting should be determined according to actual Error AMP compensator design and measurement.

When overshoot exceeds the set trigger level, all PWMs keep in tri-state until the zero current is detected or VSEN returns to normal level. Turning off LGs forces positive current flow through body diode to cause diode forward voltage drop. The extra forward voltage can speed up inductor current discharge and decrease overshoot.

18.34 ACLK Performance Enhancement

The RT3674FE provides undershoot suppression function to improve undershoot by applying a positive offset at loading edge. The controller detects the COMP signal and compares it with steady state. When VCOMP variation exceeds a threshold, an additional positive offset is added to the output voltage. The undershoot suppression threshold can be selected through NVM register of AR_TH_B and AR_TH_C.

The smaller index indicates that the detection is triggered easily. Figure 32 shows undershoot suppression behavior in single phase. For different platforms, the optimized settings are different. The final setting must be based on the actual measurement.

Figure 32. Undershoot Suppression Behavior in Single Phase

18.35 Overcurrent Protection (OCP)

The RT3674FE supports two-level overcurrent protection for all rails, OCP fault and OCP warning. The first level is OCP warning. Set minimum pulse and threshold via OCP_WARN_THRESH Reg0x28[7:0] with a period of time OCP_WARN_MIN_PULSE Reg0x29[7:3] for assertion OCP_L. OCP_WARN bit is sticky in the TEMP1/WARN telemetry packet and FAULT_STATUS Reg0x10[4]. During a warning condition, the controller behavior will be unaffected.

The first level, the threshold of OCP warning for PSx is defined as:

$$I_{SUM_OC_PSI0, 1, 2, 3, 7} = OCP_WARN_THRESH \text{ Reg0x28[7:0]} \times 4/512$$

The second level is OCP fault. When inductor current exceeds the OCP_THRESH Reg0x27[7:0] continuously with a period of time OCP_FAULT_DELAY Reg0x29[2:0], and the controller shall latch the assertion OCP_L and FAULT_STATUS Reg0x10[0]. Only when the OCP fault is cleared, through PWR_ENABLE toggling or VCC power cycling, will the OCP_L pin de-assert.

The second level, the threshold of sum OCP for PSx is defined as:

$$I_{SUM_OC_PSI0, 1, 2, 3, 7} = OCP_THRESH \text{ Reg0x27[7:0]} \times 4/512 \times O_PH/N;$$

where O_PH = operation phase number; N = phase number in PSI0 OCP is masked during VOTF period plus 80μs after VID settles. it is also masked when VID = 0V condition.

Figure 33. OC Protection Mechanism

18.36 Overvoltage Protection (OVP)

The OVP threshold is linked with VID. The classification table is illustrated in Table 9. While VID = 0V, OVP is masked. When VID ramps up from VID = 0V till the first PWM after VID settles, OVP threshold is VID_MAX + OVP_DELTA + VOUT_OFFSET + I2C_VOUT_OFFSET to allow not-fully-discharged VSEN. However, the OVP threshold (select via OVP_DELTA Reg0x2C[6:4]) is combined by the VID or VID_MAX (select via OVP_REF Reg0x2C[7]). Those parameters can be programmable through SVI3 command.

The OV protection mechanism is illustrated in Figure 34 and Figure 35. When OVP is triggered with 0.8µs filter time, the controller de-asserts PWRGD and forces all PWMs low to turn on low-side power MOSFETs. PWM remains low until the output voltage is pulled down to below new VID target for VOTF up from 0V and below VID for other conditions. After 60µs from OVP trigger, VID starts to ramp down to 0V with slow slew rate. During the period, PWM is not allowed to turn on. The controller controls PWM to be low or in tri-state to pull down the output voltage along with VID.

VID Condition	OVP Threshold	Protection Action	Protection Reset
VID≠0	<p>VID or VID_MAX(select via 0x2C[3])</p> <p>0x2C[3] = 0b: VID $UVP_TH = VID - UVP_DELTA + VOUT_OFFSET + I2C_VOUT_OFFSET$ (MIN_VOUT_SUPPORTED ≤ VID + VOUT_OFFSET + I2C_VOUT_OFFSET)</p> <p>0x2C[3] = 1b: VID_MIN $UVP_TH = VID_MIN - UVP_DELTA + VOUT_OFFSET + I2C_VOUT_OFFSET$ (MIN_VOUT_SUPPORTED ≤ VID_MIN + VOUT_OFFSET + I2C_VOUT_OFFSET) (If VID_MIN = 0V, MIN_VOUT_SUPPORTED is used to calculate UVP threshold. $UVP_th = MIN_VOUT_SUPPORTED - UVP_DELTA$)</p>		
VOTF period from zero/non-zero VID in VFIX mode	<p>(VOTF period) UVP is masked (I2C VFIX Mode) VFIX_EN = 1b: Enable $UVP_TH = VFIX - UVP_DELTA$</p>		
VID≠0 in VFIX mode	<p>(I2C VFIX Mode) VFIX_EN = 1b: Enable $UVP_TH = VFIX - UVP_DELTA$</p>		

18.38 Thermal Considerations

The junction temperature should never exceed the absolute maximum junction temperature $T_{J(MAX)}$, listed under Absolute Maximum Ratings, to avoid permanent damage to the device. The maximum allowable power dissipation depends on the thermal resistance of the IC package, the PCB layout, the rate of surrounding airflow, and the difference between the junction and ambient temperatures. The maximum power dissipation can be calculated using the following formula:

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

where $T_{J(MAX)}$ is the maximum junction temperature, T_A is the ambient temperature, and θ_{JA} is the junction-to-ambient thermal resistance.

For continuous operation, the maximum operating junction temperature indicated under Recommended Operating Conditions is 125°C. The junction-to-

ambient thermal resistance, θ_{JA} , is highly package dependent. For a WQFN-60L 7x7 package, the thermal resistance, θ_{JA} , is 25.5°C/W on a standard JEDEC 51-7 high effective-thermal-conductivity four-layer test board.

The maximum power dissipation at $T_A = 25^\circ\text{C}$ can be calculated as below:

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (25.5^\circ\text{C/W}) = 3.92\text{W for a WQFN-60L 7x7 package.}$$

The maximum power dissipation depends on the operating ambient temperature for the fixed $T_{J(MAX)}$ and the thermal resistance, θ_{JA} . The derating curves in Figure 37 allows the designer to see the effect of rising ambient temperature on the maximum power dissipation.

Figure 37. Derating Curve of Maximum Power Dissipation

19 Functional Register Description

19.1 I²C Interface

The I²C slave address = 0x20, 0x21, 0x22 or 0x23 by CONFIG pin set.

This I²C does not have a stretch function.

The I²C interface supports standard slave mode (100 kbps), and fast mode (400 kbps). The write or read bit stream (N>1) is shown below:

Read N bytes from VR

Write N bytes to VR

■ Driven by Master, ■ Driven by Slave (VR), P Stop, S Start, Sr Repeat Start

Table 11. Register Map

Register Address	NAME	Type	PAGED	Default Value	NVM
DFh	WDR	R/W	No	0x03	Yes(GP1)

EFh	PAGE	R/W	No	0x03	No
FBh	PRODUCT_ID	R	No	0x74	No
FCh	MODEL_ID	R	No	0x01	No

Table 12

Register Address: DFh								
Description: Watchdog-reset status, enable/disable watchdog function and setting watchdog-reset period.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	WDR							
Default Value	0x03							
Read/Write	R	R	R	R	R	R	R/W	R/W
Bits	Name		Description					
[7]	WATCHDOG_STATUS		Watchdog-Reset Status [7] = 0: Normal SMBus transmission [7] = 1: SMBus transmission hanging exceeds watchdog-reset period					
[6:2]	Reserved		Reserved bits					
[1]	EN_WATCHDOG_RESET		Enable/Disable watchdog function [1] = 0: Disable Watchdog-Reset (If SMBus transition hanging exceeds 30ms, VR I ² C interface state machine is reset but all registers keep the latest value.) [1] = 1: Enable Watchdog-Reset (Watchdog period is based on WATCHDOG_RESET_PERIOD[0] setting. When SMBus transmission hanging exceeds the setting, all I ² C registers reset to the default value. (Default)The default value can be set by NVM.					
[0]	WATCHDOG_RESET_PERIOD		Watchdog-Reset period [0] = 0: 800ms [0] = 1: 1600ms (Default) The default value can be set by NVM.					

Table 13

Register Address: ECh								
Description: NVM status indicator.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	NVM_PROGRAM_STATUS							
Default Value	Current status							
Read/Write	R	R	R	R	R	R	R	R
Bits	Name		Description					
[7]	RESTORE_FLAG		[7] = 1: Restore done.					
[6]	STORE_FLAG		[6] = 1: Store done.					
[5]	STORE_ALLOW		[5] = 1: Allow to store.					
[4]	RESTORE_BUSY		[4] = 1: NVM restore busy.					
[3]	STORE_BUSY		[3] = 1: NVM store busy.					
[2]	CRC_GROUP_0		[2] = 1: GROUP_0 (Page 03, 04 and 05) check fails.					
[1]	CRC_GROUP_1		[1] = 1: GROUP_1 (Page 02) check fails.					
[0]	CRC_GP0_GP1		[0] = 1: Group 0 or group 1 check fails.					

Table 14

Register Address: EDh								
Description: Store command instructs the device to copy the entire contents of the Operating Memory to the matching locations in the non-volatile User Store memory. Restore command instructs the device to copy the entire contents of the non-volatile User Store memory to the matching locations in the Operating Memory. This command should only be used while all outputs are disabled.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	STORE_RESTORE_CFG							
Default Value	0x00							
Read/Write	W	W	W	W	W	W	W	W
Bits	Name		Description					
[7:0]	STORE_RESTORE_CFG		[7:0] = 66h: Restore all storable register settings from NVM. [7:0] = AAh: Store all current storable register settings into NVM as new defaults. All other combinations are not defined.					

Table 15

Register Address: EFh								
Description: The PAGE command provides the ability to configure, control and monitor multiple PWM channels through only one physical address. Each PAGE contains the operating commands for one PWM channel.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	PAGE							
Default Value	0x03							
Read/Write	R	R	R	R	R	RW	RW	RW
Bits	Name		Description					
[7:0]	Channel		[7:0] = 02h: All rail setting functions (Page 02). [7:0] = 03h: rail A (Page 03). [7:0] = 04h: rail B (Page 04). [7:0] = 05h: rail C (Page 05). All other combinations are not defined.					

Table 16

Register Address: FBh								
Description: The Product_ID command indicates the device code is 74 - code identifier for RT3674.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	Product_ID							
Default Value	0x74							
Read/Write	R	R	R	R	R	R	R	R
Bits	Name		Description					
[7:0]	Product_ID		[7:0] = 74h					

Table 17

Register Address: FCh								
Description: Unique model code defined by manufacturer. (Same as SV13 Reg. 03h.)								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	MODEL_ID							
Default Value	0x01

Table 23

Register Address: 80h								
Description: Setting VOUT offset of rail A. The capability of controller is 0.25V~2.8V. (i.e. $0.25V \leq VID \text{ setting} \pm SVI3 \text{ VOUT_OFFSET} \pm I2C \text{ VOUT_OFFSET} \leq 2.8V$). The offset slew rate is 1/4 of SVI3 UP_SLEW_RATE. The minimum slew rate is 2.5 mV/μs. The VR begins ramping up and return to PSI0 when setting VOUT offset. PSI state returns to the original state after the output voltage is within tolerance and start-up ramping is complete. If CPU sends change PSI command, the controller follows change PSI command and VOUT offset still exists. When CPU sends VID off command, the output voltage is 0V.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	I2C_VOUT_OFS_A							
Default Value	0x00							
Read/Write	RW	RW	RW	RW	RW	RW	RW	RW
Bits	Name		Description					
[7:0]	OFS		[7:0] = 00h: no offset [7]: sign bit (as part of two's complement) [6:0]: 5mV/step [e.g.] 00000001 = current VID + (1 x VID step) 00000011 = current VID + (3 x VID steps) 11111111 = current VID - (1 x VID step) The default value can be set by NVM.(Page 03)					

Table 24

Register Address: 81h								
Description: Enable/Disable fixed VID mode of rail A.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	EN_VFIX_A							
Default Value	0x00							
Read/Write	R	R	R	R	R	R	R	RW
Bits	Name		Description					
[7:1]	Reserved		Reserved bits					
[0]	EN_VFIX		[0] = 0: Disable fixed VID mode [0] = 1: Enable fixed VID mode					

Table 25

Register Address: 82h								
Description: 9-bit fixed VID (Reg. 0x82h + Reg. 0x83h). Set voltage in fixed VID mode of rail A. In fixed VID mode, VR skips VID packet and changes PSI commands. While fixed VID is enabled, VR does not act for I2C VOUT_OFFSET as well. After disabling fixed VID mode, VID returns to the last VID packet target and last power state. When entering/exiting fixed VID mode, the slew rate is 1/4 of SVI3 UP_SLEW_RATE.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	VFIX_LSB_A							
Default Value	0x83							
Read/Write	RW	RW	RW	RW	RW	RW	RW	RW
Bits	Name		Description					
[7:0]	VFIX_LSB		VFIX[8:0] = VFIX_MSB[0]+VFIX_LSB[7:0] Voltage of fixed VID mode = 0.0V when receives an off code (VFIX[8:0] = 000h) Voltage of fixed VID mode = 0.245V+VFIX[8:0]×5mV, voltage ranges from 0.25V to 2.8V.					

Table 26

Register Address: 83h								
Description: 9-bit fixed VID (Reg. 0x82h + Reg. 0x83h). Set voltage in fixed VID mode of rail A. In fixed VID mode, VR skips VID packet and changes PSI commands. While Fixed VID is enable, VR does not act for I2C VOUT_OFFSET as well. After disabling fixed VID mode, VID returns to the last VID packet target and last power state. When entering/exiting fixed VID mode, the slew rate is 1/4 of SVI3 UP_SLEW_RATE.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

Table 38

Register Address: A2h								
Description: 9-bit fixed VID (Reg. A2h + Reg. A3h). Set maximum voltage in fixed VID mode of rail A.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	VFIX_MAX_LSB_A							
Default Value	0xFF							
Read/Write	RW	RW	RW	RW	RW	RW	RW	RW
Bits	Name		Description					
[7:0]	VFIX_MAX_LSB		VFIX_MAX[8:0] = VFIX_MAX_MSB[0]+VFIX_MAX_LSB[7:0] Voltage of fixed VID max mode = 0V when receives an off code (VFIX_MAX[8:0] = 000h) Voltage of fixed VID max mode = 0.245V+VFIX_MAX[8:0]×5mV, voltage ranges from 0.25V to 2.8V.					

Table 39

Register Address: A3h								
Description: 9-bit fixed VID (Reg. A2h + Reg. A3h). Set maximum voltage in fixed VID mode of rail A.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	VFIX_MAX_MSB_A							
Default Value	0x01							
Read/Write	R	R	R	R	R	R	R	RW
Bits	Name		Description					
[7:1]	Reserved		Reserved bits					
[0]	VFIX_MAX_MSB		VFIX_MAX[8:0] = VFIX_MAX_MSB[0]+VFIX_MAX_LSB[7:0] Voltage of fixed VID max mode = 0V when receives an off code (VFIX_MAX[8:0] = 000h) Voltage of fixed VID max mode = 0.245V+VFIX_MAX[8:0]×5mV, voltage ranges from 0.25V to 2.8V.					

Table 40

Register Address: A4h								
Description: It is used to set overcurrent warning hysteresis of rail A.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	OCP_WARN_HYS_A							
Default Value	0x00							
Read/Write	RW	RW	RW	RW	RW	RW	RW	RW
Bits	Name		Description					
[7:0]	OCP_WARN_HYS		1LSB = I_OUT_SCALE/384 A The default value can be set by NVM. (Page 03).					

Table 41

Register Address: A5h								
Description: Set IGNORE_PSI7, FORCE_PSI7, SVI3_I ² C_VRHOT and SVI3_I ² C_OTP.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	MISC_A							
Default Value	0x00							
Read/Write	R	R	R	R	RW	RW	RW	RW
Bits	Name		Description					
[7:4]	Reserved		Reserved bits					
[3]	IGNORE_PSI7		[3] = 0: Disable, Follow SVI3 power states (default) [3] = 1: Enable, VR ignores PSI7 command and operates in full phase count when receiving the PSI7 command. The SVI3 Register PSI state follows SVI3 command and ACK PSI change command. The default value can be set by NVM. (Page 03).					
[2]	FORCE_PSI7		[2] = 0: Disable, Follow SVI3 power states (default) [2] = 1: Enable, Fixed in PSI7 and ignore other PSIx command. VR always enable smart phase management function. The SVI3 Register PSI state follow SVI3 command and ACK PSI change command. The default value can be set by NVM. (Page 03).					
[1]	SVI3_I ² C_VRHOT		It is used to set VRHOT threshold control mode. [1] = 0: SVI3 (default) [1] = 1: I ² C The default value can be set by NVM. (Page 03).					
[0]	SVI3_I ² C_OTP		It is used to set OTP threshold control mode. [0] = 0: SVI3 (default) [0] = 1: I ² C The default value can be set by NVM. (Page 03).					

Table 42. VR Operation mode:

FORCE_PSI0	IGNORE_PSI7	FORCE_PSI7	VR Operation mode
Disable	Disable	Disable	Follow SVI3 power states.
Disable	Disable	Enable	Force PSI7.
Disable	Enable	Disable	Follow SVI3 power states except PSI7. Operator in PSI0 when received PSI7.
Disable	Enable	Enable	Follow SVI3 power states.
Enable	Disable	Disable	Force PSI0.
Enable	Disable	Enable	Force PSI0.
Enable	Enable	Disable	Force PSI0.
Enable	Enable	Enable	Force PSI0.

Table 43

Register Address: A6h								
Description: It is used to set VRHOT threshold of rail A.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	VRHOT_TH_A							
Default Value	0x8C							
Read/Write	RW	RW	RW	RW	RW	RW	RW	RW
Bits	Name		Description					
[7:0]	VRHOT_TH		Voltage regulator hot warning threshold when control mode is I ² C. VRHOT Threshold = Reg[7:0]-40°C [7:0] = 00h: Disabled [7:0] = 8Ch: 100°C (default) The default value can be set by NVM. (Page 03).					

Table 44

Register Address: A7h								
Description: It is used to set OTP threshold of rail A.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	OTP_TH_A							
Default Value	0xA5							
Read/Write	RW	RW	RW	RW	RW	RW	RW	RW
Bits	Name		Description					
[7:0]	OTP_TH		Over-temperature protection threshold when control mode is I ² C. OTP Threshold = Reg[7:0]-40°C [7:0] = 00h: Disabled [7:0] = A5h: 125°C (default) The default value can be set by NVM. (Page 03).					

Table 45

Register Address: A9h								
Description: System power reporting consists of a 10-bit encoding mapped to P_SYS_SCALE. PSYS_RPT should read PSYS_RPT_MSB first and then read PSYS_RPT_LSB. (Reg. A9h+Reg. AAh)								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	PSYS_RPT_MSB							
Default Value	current status							
Read/Write	R	R	R	R	R	R	R	R

Table 48

Register Address: 80h								
Description: Setting VOUT offset of rail B. The capability of controller is 0.25V~2.8V. (i.e. $0.25V \leq VID \text{ setting} \pm SVI3 \text{ VOUT_OFFSET} \pm I2C \text{ VOUT_OFFSET} \leq 2.8V$). The offset slew rate is 1/4 of SVI3 UP_SLEW_RATE. The minimum slew rate is 2.5 mV/μs. The VR begins ramping up and returns to PSI0 when setting VOUT offset. PSI state returns to original state after the output voltage is within tolerance and start-up ramping is complete. If CPU sends change PSI command, the controller follows change PSI command and VOUT offset still exists. When CPU sends VID off command, the output voltage is 0V.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	I2C_VOUT_OFS_B							
Default Value	0x00							
Read/Write	RW	RW	RW	RW	RW	RW	RW	RW
Bits	Name		Description					
[7:0]	OFS		[7:0] = 00h: no offset [7]: sign bit (as part of two's complement) [6:0]: 5mV/step [e.g.] 00000001 = current VID + (1 x VID step) 00000011 = current VID + (3 x VID steps) 11111111 = current VID - (1 x VID step) The default value can be set by NVM. (Page 04).					

Table 49

Register Address: 81h								
Description: Enable/Disable fixed VID mode of rail B.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	EN_VFIX_B							
Default Value	0x00							
Read/Write	R	R	R	R	R	R	R	RW
Bits	Name		Description					
[7:1]	Reserved		Reserved bits					
[0]	EN_VFIX		[0] = 0: Disable fixed VID mode [0] = 1: Enable fixed VID mode					

Table 50

Register Address: 82h								
Description: 9-bit fixed VID (Reg. 82h + Reg. 83h). Set voltage in fixed VID mode of rail B. In fixed VID mode, VR skips VID packet and change PSI commands. While fixed VID is enabled, VR does not act for I2C VOUT_OFFSET as well. After disabling fixed VID mode, VID returns to the last VID packet target and last power state. When entering/exiting fixed VID mode, the slew rate is 1/4 of SVI3 UP_SLEW_RATE.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	VFIX_LSB_B							
Default Value	0x83							
Read/Write	RW	RW	RW	RW	RW	RW	RW	RW
Bits	Name		Description					
[7:0]	VFIX_LSB		VFIX[8:0] = VFIX_MSB[0]+VFIX_LSB[7:0] Voltage of fixed VID mode = 0.0V when receiving an off code (VFIX[8:0] = 000h) Voltage of fixed VID mode = $0.245V + VFIX[8:0] \times 5mV$, voltage ranges from 0.25V to 2.8V.					

Table 51

Register Address: 83h								
Description: 9-bit fixed VID (Reg. 82h + Reg. 83h). Set voltage in fixed VID mode of rail B. In fixed VID mode, VR skips VID packet and change PSI commands. While Fixed VID is enabled, VR does not act for I2C VOUT_OFFSET as well. After disabling fixed VID mode, VID returns to the last VID packet target and last power state. When entering/exiting fixed VID mode, the slew rate is 1/4 of SVI3 UP_SLEW_RATE.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

Register Address: 9Dh								
Description: 9-bit fixed VID (Reg. 9Ch + Reg. 9Dh). Set maximum voltage in fixed VID mode of rail B.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	VFIX_MAX_MSB_B							
Default Value	0x01							
Read/Write	R	R	R	R	R	R	R	RW
Bits	Name		Description					
[7:1]	Reserved		Reserved bits					
[0]	VFIX_MAX_MSB		VFIX_MAX[8:0] = VFIX_MAX_MSB[0]+VFIX_MAX_LSB[7:0] Voltage of fixed VID max mode = 0V when receiving an off code (VFIX_MAX[8:0] = 000h) Voltage of fixed VID max mode = 0.245V+VFIX_MAX[8:0]×5mV, voltage ranges from 0.25V to 2.8V.					

Table 65

Register Address: 9Eh								
Description: It is used to set overcurrent warning hysteresis of rail B.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	OCP_WARN_HYS_B							
Default Value	0x00							
Read/Write	RW	RW	RW	RW	RW	RW	RW	RW
Bits	Name		Description					
[7:0]	OCP_WARN_HYS		1LSB = I_OUT_SCALE/384 A The default value can be set by NVM. (Page 04).					

Table 66

Register Address: 9Fh								
Description: Set IGNORE_PSI7, FORCE_PSI7, SVI3_I ² C_VRHOT and SVI3_I ² C_OTP.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	MISC_B							
Default Value	0x00							
Read/Write	R	R	R	R	RW	RW	RW	RW
Bits	Name		Description					
[7:4]	Reserved		Reserved bits					
[3]	IGNORE_PSI7		[3] = 0: Disable, Follow SVI3 power states (default) [3] = 1: Enable, VR ignores PSI7 command and operates in full phase count when receiving the PSI7 command. The SVI3 Register PSI state follows SVI3 command and ACK PSI change command. The default value can be set by NVM. (Page 04).					
[2]	FORCE_PSI7		[2] = 0: Disable, Follow SVI3 power states (default) [2] = 1: Enable, Fixed in PSI7 and ignore other PSIx command. VR always enables smart phase management function. The SVI3 Register PSI state follows SVI3 command and ACK PSI change command. The default value can be set by NVM. (Page 04).					
[1]	SVI3_I ² C_VRHOT		It is used to set VRHOT threshold control mode. [1] = 0: SVI3 (default) [1] = 1: I ² C The default value can be set by NVM. (Page 04).					
[0]	SVI3_I ² C_OTP		It is used to set OTP threshold control mode. [0] = 0: SVI3 (default) [0] = 1: I ² C The default value can be set by NVM. (Page 04).					

Table 67. VR Operation Mode:

FORCE_PSI0	IGNORE_PSI7	FORCE_PSI7	VR Operation mode
Disable	Disable	Disable	Follow SVI3 power states.
Disable	Disable	Enable	Force PSI7.
Disable	Enable	Disable	Follow SVI3 power states except PSI7. Operator in PSI0 when received PSI7.
Disable	Enable	Enable	Follow SVI3 power states.
Enable	Disable	Disable	Force PSI0.
Enable	Disable	Enable	Force PSI0.
Enable	Enable	Disable	Force PSI0.
Enable	Enable	Enable	Force PSI0.

Table 68

Register Address: A1h								
Description: It is used to set VRHOT threshold of rail B.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	VRHOT_TH_B							
Default Value	0x8C							
Read/Write	RW	RW	RW	RW	RW	RW	RW	RW
Bits	Name		Description					
[7:0]	VRHOT_TH		Voltage regulator hot warning threshold when control mode is I ² C. VRHOT Threshold = Reg[7:0]-40°C [7:0] = 00h: Disabled [7:0] = 8Ch: 100°C (default) The default value can be set by NVM. (Page 04).					

Table 69

Register Address: A2h								
Description: It is used to set OTP threshold of rail B.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	OTP_TH_B							
Default Value	0xA5							
Read/Write	RW	RW	RW	RW	RW	RW	RW	RW
Bits	Name		Description					
[7:0]	OTP_TH		Over-temperature protection threshold when control mode is I ² C. OTP Threshold = Reg[7:0]-40°C [7:0] = 00h: Disabled [7:0] = A5h: 125°C (default) The default value can be set by NVM. (Page 04).					

Table 70

Register Address: A9h								
Description: System power reporting consists of a 10-bit encoding mapped to P_SYS_SCALE. PSYS_RPT should read PSYS_RPT_MSB first and then read PSYS_RPT_LSB. (Reg. A9h+Reg. AAh)								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

Table 73

Register Address: 80h								
Description: Setting VOUT offset of rail C. The capability of controller is 0.25V to 2.8V. (i.e. $0.25V \leq VID \text{ setting} \pm SVI3 \text{ VOUT_OFFSET} \pm I2C \text{ VOUT_OFFSET} \leq 2.8V$). The offset slew rate is 1/4 of SVI3 UP_SLEW_RATE. The minimum slew rate is 2.5 mV/ μ s. The VR begins ramping up and returns to PSI0 when setting VOUT offset. PSI state returns to original state after the output voltage is within tolerance and start-up ramping is complete. If CPU sends change PSI command, the controller follows change PSI command and VOUT offset still exists. When CPU sends VID off command, the output voltage is 0V.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	I2C_VOUT_OFS_C							
Default Value	0x00							
Read/Write	RW	RW	RW	RW	RW	RW	RW	RW
Bits	Name		Description					
[7:0]	OFS		[7:0] = 00h: no offset [7]: sign bit (as part of two's complement) [6:0]: 5mV/step [e.g.] 00000001 = current VID + (1 x VID step) 00000011 = current VID + (3 x VID steps) 11111111 = current VID - (1 x VID step) The default value can be set by NVM. (Page 05).					

Table 74

Register Address: 81h								
Description: Enable/Disable fixed VID mode of rail C.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	EN_VFIX_C							
Default Value	0x00							
Read/Write	R	R	R	R	R	R	R	RW
Bits	Name		Description					
[7:1]	Reserved		Reserved bits					
[0]	EN_VFIX		[0] = 0: Disable fixed VID mode [0] = 1: Enable fixed VID mode					

Table 75

Register Address: 82h								
Description: 9-bit fixed VID (Reg. 0x82h + Reg. 0x83h). Set voltage in fixed VID mode of rail C. In fixed VID mode, VR skips VID packet and change PSI commands. While fixed VID is enabled, VR does not act for I2C VOUT_OFFSET as well. After disabling fixed VID mode, VID returns to the last VID packet target and last power state. When entering/exiting fixed VID mode, the slew rate is 1/4 of SVI3 UP_SLEW_RATE.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	VFIX_LSB_C

Read/Write	RW	RW	RW	RW	RW	RW	RW	RW
Bits	Name		Description					
[7:0]	VRHOT_TH		Voltage regulator hot warning threshold when control mode is I ² C. VRHOT Threshold = Reg[7:0]-40°C [7:0] = 00h: Disabled [7:0] = 8Ch: 100°C (default) The default value can be set by NVM. (Page 05).					

Table 94

Register Address: A2h								
Description: It is used to set OTP threshold of rail C.								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	OTP_TH_C							
Default Value	0xA5							
Read/Write	RW	RW	RW	RW	RW	RW	RW	RW
Bits	Name		Description					
[7:0]	OTP_TH		Over-temperature protection threshold when control mode is I ² C. OTP_TH Threshold = Reg[7:0]-40°C [7:0] = 00h: Disabled [7:0] = A5h: 125°C (default) The default value can be set by NVM. (Page 05).					

Table 95

Register Address: A9h								
Description: System power reporting consists of a 10-bit encoding mapped to P_SYS_SCALE. PSYS_RPT should read PSYS_RPT_MSB first and then read PSYS_RPT_LSB. (Reg. A9h+Reg. AAh)								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	PSYS_RPT_MSB							
Default Value	current status							
Read/Write	R	R	R	R	R	R	R	R
Bits	Name		Description					
[7:2]	Reserved		Reserved bits					
[1:0]	PSYS_RPT		PSYS_RPT[9:0] = PSYS_RPT_MSB[1:0]+PSYS_RPT_LSB[7:0] PSYS(W) = PSYS_RPT[9:0]*MAX_POWER/1023 Note: MAX_POWER = 3FFh of selected system power scale					

Table 96

Register Address: AAh								
Description: System power reporting consists of a 10-bit encoding mapped to P_SYS_SCALE. PSYS_RPT should read PSYS_RPT_MSB first and then read PSYS_RPT_LSB. (Reg. A9h+Reg. AAh)								
Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Name	PSYS_RPT_LSB							
Default Value	current status							
Read/Write	R	R	R	R	R	R	R	R
Bits	Name		Description					
[7:0]	PSYS_RPT		PSYS_RPT[9:0] = PSYS_RPT_MSB[1:0]+PSYS_RPT_LSB[7:0] PSYS(W) = PSYS_RPT[9:0]×MAX_POWER/1023 Note: MAX_POWER = 3FFh of selected system power scale					

Table 97. SVI3 Registers for SVI3 Protocol

Addr (Hex)	Bits	Register Name	Type	Default Value	Note
01h	[7:0]	SVI3_VERSION	R	01h	Rev.1
02h	[7:5]	TYPE_ID	R	000b	Type 1
	[4:0]	MGF_ID	R	04h	04h = Richtek
03h	[7:0]	MODEL_ID	R	01h	
04h	[7:0]	TEN_BIT_TEL_AVAIL	R	47h	System Power, Temp 1, Output voltage and Output current of 10-bit telemetry are available.
05h	[7:0]	SIXTEEN_BIT_TEL_AVAIL	R	00h	Reserved
06h	[7]	CRC_ENABLED	R	1b	CRC is enabled
	[4:2]	PSI	R	000b	PSI0. Indicates the PSI state of the controller.
	[0]	VID[8]	R	Platform	Indicates the MSB of the VID. Default VID copied from VID_DEFAULT_VOLTAGE
07h	[7:0]	VID[7:0]	R	Platform	Indicates the 8 LSBs of the VID. Default VID copied from VID_DEFAULT_VOLTAGE
08h	[5:4]	DEFAULT_SLEW_RATE	R	Platform	NVM configurable, based on platform
	[3:0]	VID_DEFAULT_VOLTAGE	R	Platform	NVM configurable, based on platform
09h	[7:6]	V_IN_SCALE	R	00b	Not support
	[5:3]	I_OUT_SCALE	R	Platform	NVM configurable, based on platform
	[2:0]	I_IN_SCALE	R	000b	Not support
0Ah	[7:0]	MAX_VOUT_SUPPORTED	R	8Ch	MAX_VOUT_SUPPORTED = 2.8V
0Bh	[7:0]	MIN_VOUT_SUPPORTED	R	32h	MIN_VOUT_SUPPORTED = 0.25V
0Ch	[2:0]	P_SYS_SCALE	R	Platform	NVM configurable, based on platform
10h	[7:0]	FAULT_STATUS	R	Current status	
11h	[7:0]	NACK_STATUS	R	Current status	
20h	[7:5]	DECAY_CONDITIONS	R/W	000b	Down voltage decay disabled
	[4]	DOWN_SLEW_RATE	R/W	0b	Negative slew rate = positive slew rate
	[3:0]	UP_SLEW_RATE	R/W	Platform	Copied from DEFAULT_SLEW_RATE
21h	[4:0]	LL_ADJUST	R/W	01010b	100%
22h	[7:0]	VOUT_OFFSET	R/W	00h	No offset
23h	[7:0]	VID_MAX	R/W	00h	Disabled
24h	[7:0]	VID_MIN	R/W	00h	Disabled
25h	[7:0]	TEN_BIT_TEL_EN	R/W	00h	Disabled
26h	[7:0]	SIXTEEN_BIT_TEL_EN	R/W	00h	Reserved
27h	[7:0]	OCP_THRESH	R/W	Platform	NVM configurable, based on platform
28h	[7:0]	OCP_WARN_THRESH	R/W	Platform	NVM configurable, based on platform

Addr (Hex)	Bits	Register Name	Type	Default Value	Note
29h	[7:3]	OCP_WARN_MIN_PULSE	R/W	Platform	NVM configurable, based on platform
	[2:0]	OCP_FAULT_DELAY	R/W	Platform	NVM configurable, based on platform
2Ah	[7:0]	VRHOT_THRESH	R/W	8Ch	100°C
2Bh	[7:0]	OTP_THRESH	R/W	A5h	125°C
2Ch	[7]	OVP_REF	R/W	0b	VID
	[6:4]	OVP_DELTA	R/W	110b	350mV
	[3]	UVP_REF	R/W	0b	VID
	[2:0]	UVP_DELTA	R/W	110b	350mV
2Dh	[7:4]	PHASE_SHED_1	R/W	0001b	1-phase when slave is in PSI1
	[3:0]	PHASE_SHED_2	R/W	0001b	1-phase when slave is in PSI2
40h	[7:0]	DEBUG_ENABLED	R/W	00h	
41h	[7:0]	DEBUG_TEMP1_OVERRIDE	R/W	00h	
42h	[7:0]	DEBUG_VOUT_OVERRIDE	R/W	00h	
43h	[7:0]	DEBUG_VOUT_OVERRIDE	R/W	00h	
44h	[7:0]	DEBUG_IOUT_OVERRIDE	R/W	00h	
45h	[7:0]	DEBUG_IOUT_OVERRIDE	R/W	00h	
46h	[2:0]	DEBUG_OUTPUT_OVERRIDE	R/W	000b	
50h	[7:0]	GEN_PURPOSE_0	R/W	00b	
51h	[7:0]	GEN_PURPOSE_1	R/W	00b	
52h	[7:0]	GEN_PURPOSE_2	R/W	00b	
53h	[7:0]	GEN_PURPOSE_3	R/W	00b	
54h	[7:0]	GEN_PURPOSE_4	R/W	00b	
55h	[7:0]	GEN_PURPOSE_5	R/W	00b	
56h	[7:0]	GEN_PURPOSE_6	R/W	00b	
57h	[7:0]	GEN_PURPOSE_7	R/W	00b

W-Type 60L QFN 7x7 Package

21 Footprint Information

Package	Number of Pin	Footprint Dimension (mm)									Tolerance
		P	Ax	Ay	Bx	By	C	D	Sx	Sy	
V/W/U/XQFN7*7-60	60	0.40	7.80	7.80	6.10	6.10	0.85	0.20	5.70	5.70	±0.05

22 Packing Information

22.1 Tape and Reel Data

Package Type	Tape Size (W1) (mm)	Pocket Pitch (P) (mm)	Reel Size (A)		Units per Reel	Trailer (mm)	Leader (mm)	Reel Width (W2) Min./Max. (mm)
			(mm)	(in)				
QFN/DFN 7x7	16	12	330	13	2,500	160	600	16.4/18.4

C, D and K are determined by component size. The clearance between the components and the cavity is as follows:
 - For 16mm carrier tape: 1.0mm max.

Tape Size	W1		P		B		F		ØJ		H
	Max.	Min.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Max.
16mm	16.3mm	11.9mm	12.1mm	1.65mm	1.85mm	3.9mm	4.1mm	1.5mm	1.6mm	0.6mm	

22.2 Tape and Reel Packing

Step	Photo/Description	Step	Photo/Description
1	 <p>Reel 13"</p>	4	 <p>1 reel per inner box Box G</p>
2	 <p>HIC & Desiccant (2 Unit) inside</p>	5	 <p>6 inner boxes per outer box</p>
3	 <p>Caution label is on backside of Al bag</p>	6	 <p>Outer box Carton A</p>

Package	Container	Reel		Box			Carton				
		Size	Units	Item	Weight(kg)	Reels	Units	Item	Weight(kg)	Boxes	Units
QFN and DFN 7x7		13"	2,500	Box G	1.11	1	2,500	Carton A	7.4	6	15,000

22.3 Packing Material Anti-ESD Property

Surface Resistance	Aluminum Bag	Reel	Cover tape	Carrier tape	Tube	Protection Band
Ω/cm^2	$10^4 \sim 10^{11}$	$10^4 \sim 10^{11}$	$10^4 \sim 10^{11}$	$10^4 \sim 10^{11}$	$10^4 \sim 10^{11}$	$10^4 \sim 10^{11}$
