

2.4MHz 2A Step-Down Converter with I²C Interface

General Description

The RT5742 is a step-down switching voltage regulator that delivers a digitally programmable output from an input voltage supply of 2.5V to 5.5V. The output voltage is programmed through an I²C interface capable of operating up to 3.4MHz.

Using a proprietary architecture with synchronous rectification, the RT5742 is capable of delivering 2A continuously at over 80% efficiency, maintaining that efficiency at load currents as low as 10mA. The regulator operates at a nominal fixed frequency of 2.4MHz, which reduces the value of the external components. Additional output capacitance can be added to improve regulation during load transients without affecting stability.

At moderate and light loads, Pulse Frequency Modulation (PFM) is used to operate in Power-Save Mode with a typical quiescent current of 50μA at room temperature. Even with such a low quiescent current, the part exhibits excellent transient response during large load swings. At higher loads, the system automatically switches to fixed frequency control, operating at 2.4MHz. In the Shutdown Mode, the supply current drops below 1μA, reducing power consumption. The PFM Mode can be disabled if fixed frequency is desired. The RT5742 is available in a small WL-CSP-11B 1.31x1.62 (BSC).

The recommended junction temperature range is -40°C to 125°C.

Features

- **Programmable Output Voltage Range: 0.3V to 1.3V, 5mV/bit**
- **Programmable Slew Rate for Voltage Transitions**
- **Steady 2.4MHz Switching Frequency**
- **Fast Load Transient with ACOT[®] Control Topology**
- **Continuous Output Current Capability: 2A**
- **2.5V to 5.5V Input Voltage Range**
- **Digitally Programmable Output Voltage**
- **I²C-Compatible Interface Up to 3.4MHz**
- **Selectable Auto PFM/PWM Mode for High Efficiency at Light Load**
- **Quiescent Current in PFM Mode: 50μA (Typical)**
- **Input Undervoltage Lockout (UVLO)**
- **Thermal Shutdown and Overload Protection**
- **Power Good Indicator for Sequence Control**

Applications

- Wearable and Portable Electronic Devices
- DDR Memories, LPDDR3, LPDDR4, LPDDR5
- Tablets, Netbooks, Ultra-Mobile PCs
- Smart Speakers, Voice Assistant Devices
- TV Stick, OTT and Home Entertainment Devices

Functional Pin Description

Pin No.	Pin Name	Pin Function
A1, B1	VIN	Power input voltage. Connect to the input power source. Connect to C _{IN} with minimal path.
A2	SW	Switching node. Connect to the inductor.
A3	PGND	Power ground. The low-side MOSFET is referenced to this pin. C _{IN} and C _{OUT} should be returned with a minimal path to these pins.
B3	PG	Power good indicator. The output of this pin is an open-drain with external pull-up resistor. After soft-startup, PG is pulled up when the FB voltage is within 87% (typ.). The PG status is low while EN is disabled. Note that when VIN is lower than 2.32V (typ.), the PG pin will keep low to indicate the power is not ready.
C1	VSEL	Voltage select. When this pin is low, V _{OUT} is set by the VSEL0 register. When this pin is high, V _{OUT} is set by the VSEL1 register. Polarity of this pin in conjunction with the mode bits in the Control register 02h will select Forced PWM or Auto PFM/PWM mode of operation.
C2	EN	Enable control input. A logic-high enables the converter; a logic-low forces the device into shutdown mode, and will reset all registers to the default value.
C3	VOUT	V _{OUT} . Output voltage sense through this pin. Connect to output capacitor.
D1	AGND	Analog ground. All signals are referenced to this pin. Avoid routing high dV/dt AC currents through this pin.
D2	SCL	I ² C serial clock.
D3	SDA	I ² C serial data.

Function Block Diagram

Absolute Maximum Ratings (Note 1)

- Supply Input Voltage, VIN----- -0.3V to 7V
- Switch Node Voltage ----- -0.3V to 7.3V
 <50ns ----- -5V to 8.5V
- Other I/O Pins Voltages----- -0.3V to 7.3V
- Junction Temperature ----- 150°C
- Lead Temperature (Soldering, 10 sec.)----- 260°C
- Storage Temperature Range ----- -65°C to 150°C

ESD Ratings

- ESD Susceptibility (Note 2)
 HBM (Human Body Model) ----- 2kV

Recommended Operating Conditions (Note 3)

- Supply Input Voltage, VIN----- 2.5V to 5.5V
- Output Voltage, VOUT ----- 0.3V to 1.3V
- Junction Temperature Range ----- -40°C to 125°C

Thermal Information (Note 4 and Note 5)

Thermal Parameter		WL-CSP-11B 1.31x1.62 (BSC)	Unit
θ_{JA}	Junction-to-ambient thermal resistance (JEDEC standard)	48.8	°C/W
$\theta_{JC(Top)}$	Junction-to-case (top) thermal resistance	18	°C/W
$\theta_{JC(Bottom)}$	Junction-to-case (bottom) thermal resistance	4.44	°C/W
$\theta_{JA(EVB)}$	Junction-to-ambient thermal resistance (specific EVB)	65.4	°C/W
$\Psi_{JC(Top)}$	Junction-to-top characterization parameter	2.2	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	41.1	°C/W

Electrical Characteristics

- Note 1.** Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions may affect device reliability.
- Note 2.** Devices are ESD sensitive. Handling precautions are recommended.
- Note 3.** The device is not guaranteed to function outside its operating conditions.
- Note 4.** For more information about thermal parameter, see the Application and Definition of Thermal Resistances report, [AN061](#).
- Note 5.** $\theta_{JA(EVB)}$, $\Psi_{JC(Top)}$ and Ψ_{JB} are measured on a high effective-thermal-conductivity four-layer test board which is in size of 70mm x 50mm, furthermore, all layers with 1 oz. Thermal resistance/parameter values may vary depending on the PCB material, layout, and test environmental conditions.

Typical Application Circuit

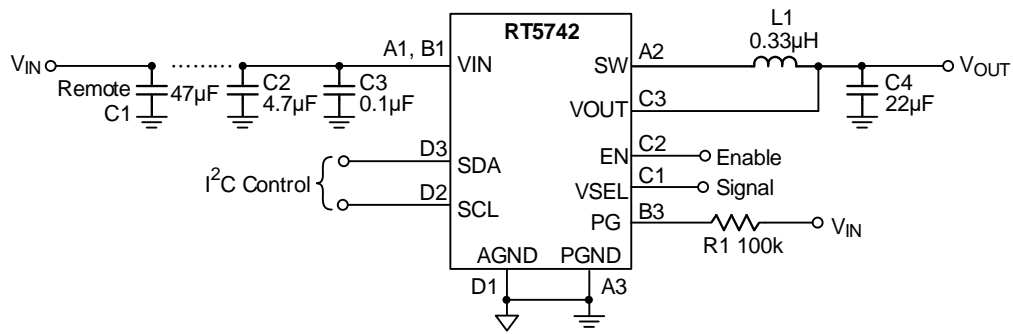

Table 1. Recommended External Components for 2A Maximum Load Current

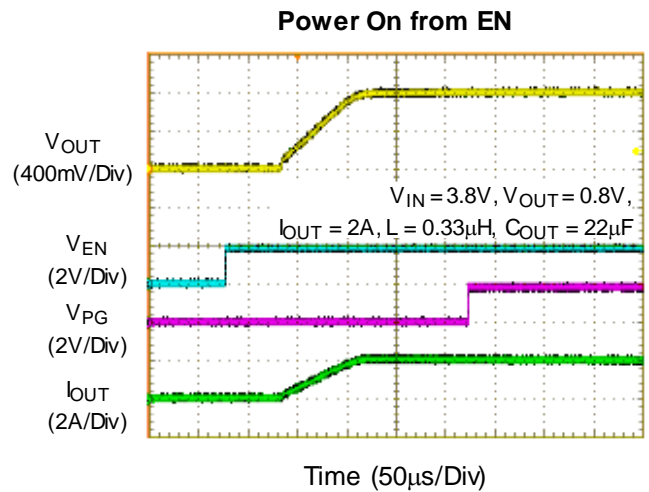

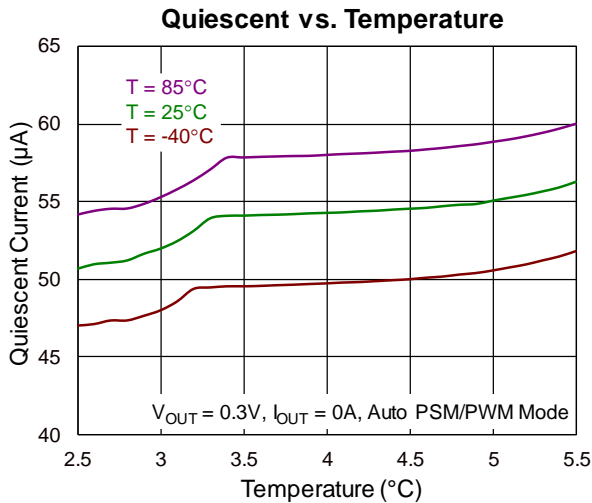

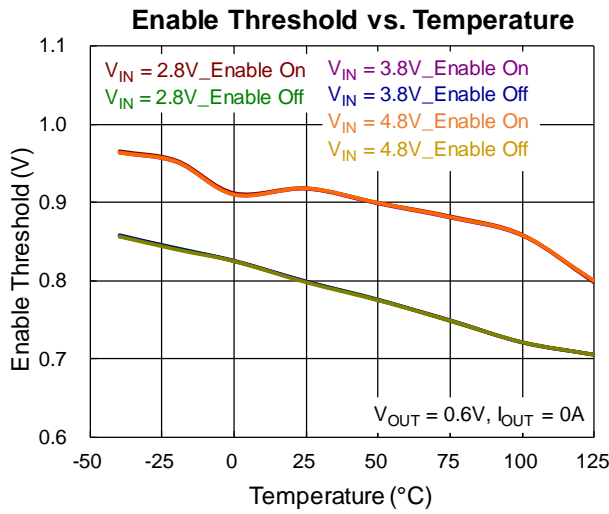

Component	Description	Vendor P/N
L1	330nH, 2016 case size	DFE201610E-R33M=P2 (Murata)
	330nH, 2520 case size	HMLQ25201T-R33MSR (Cynotec)
	330nH, 4x4 case size	744040420033 (WE)
C2	4.7µF, 10V, X5R, 0402	GRM155R61A475ME01 (Murata)
C3 ⁽¹⁾	100nF, 6.3V, X5R, 0402	GRM152R60J104KE19 (Murata)

Operation

The RT5742 is a low voltage synchronous step-down converter that supports input voltage ranging from 2.5V to 5.5V and the output current can be up to 2A. The RT5742 uses ACOT[®] mode control. To achieve good stability with low-ESR ceramic capacitors, the ACOT[®] uses a virtual inductor current ramp generated inside the IC. This internal ramp signal replaces the ESR ramp normally provided by the output capacitor's ESR. The ramp signal and other internal compensations are optimized for low-ESR ceramic output capacitors.

In steady-state operation, the feedback voltage, with the virtual inductor current ramp added, is compared to the reference voltage. When the combined signal is less than the reference, the on-time one-shot is triggered, as long as the minimum off-time one-shot is cleared and the measured inductor current (through the synchronous rectifier) is below the current limit. The on-time one-shot turns on the high-side switch and the inductor current ramps up linearly. After the on-time, the high-side switch is turned off and the synchronous rectifier is turned on and the inductor current ramps down linearly. At the same time, the minimum off-time one-shot is triggered to prevent another immediate on-time during the noisy switching time and allows the feedback voltage and current sense signals to settle. The minimum off-time is kept short so that rapidly-repeated on-times can raise the inductor current quickly when needed.

PWM Frequency and Adaptive On-Time Control

The on-time can be roughly estimated by the equation:

$$T_{ON} = \frac{V_{OUT}}{V_{IN}} \times \frac{1}{f_{SW}}$$

where f_{SW} is nominal 2.4MHz.

Auto-Zero Current Detector

The auto-zero current detector circuit senses the SW waveform to adjust the zero current threshold voltage. When the current of low-side MOSFET decrease to the zero current threshold, the low-side MOSFET turns off to prevent negative inductor current. In this way, the zero current threshold can be adjusted for different conditions to get better efficiency.

Undervoltage Protection (UVLO)

The UVLO continuously monitors the voltage of VIN to make sure the device works properly. When the VCC is high enough to reach the high threshold voltage of UVLO, the step-down converter softly starts or pre-biases to its regulated output voltage. When the VIN decreases to its low threshold (160mV hysteresis), the device will shut down.

Power Good Indication Pin

The RT5742 features an open-drain power-good output (PG) to monitor the output voltage status. The output delay of comparator prevents false flag operation for short excursions in the output voltage, such as during line and load transients. Pull-up PG with a resistor to VOUT or an external voltage below 5.5V. When VIN voltage rises above VUVLO, the power-good function is activated. After soft-start is finished, the PG pin is controlled by a comparator connected to the feedback signal VOUT. If VOUT rises above a power-good high threshold (VTH_PGLH) (typically 87% of the reference voltage), the PG pin will be in high impedance and VPG will be held high. Moreover, when VIN is above UVLO and device is powered on through EN pin, the PG pin will assert high within 300μs as soon as the VEN is above logic-high threshold; in other words, the PG delay time is around 300μs from EN asserts to logic-high. When VOUT falls below the power-good low threshold (VTH_PGHL) (typically 77% of the reference voltage), the PG pin will be pulled low after a certain delay (3μs, typically). Once being started-up, if any internal protection is triggered, PG will be pulled low to GND. The internal open-drain pull down device (11Ω, typically) will pull the PG pin low. The power good indication profile is shown in Table 1. Note that when VIN is lower than 2.32V (typically), the PG pin will keep low to indicate the power is not ready.

Figure 1. The Logic of PG

Table 2. PG Pin Status

Conditions		PG Pin
Enable	$V_{EN} > V_{EN_H}$, $V_{FB} > V_{TH_PGLH}$	High Impedance
	$V_{EN} > V_{EN_H}$, $V_{FB} < V_{TH_PGHL}$	Low
Shutdown	$V_{EN} < V_{EN_L}$	Low
OTP	$T_J > T_{SD}$	Low

Overcurrent Protection (OCP)

When the output voltage of the RT5742 is lower than 59% of the reference voltage after soft-start, the UVP is triggered.

The RT5742 senses the current signal when high-side and low-side MOSFET turns on. As a result, the OCP is cycle-by-cycle limit. If the OCP occurs, the converter holds off the next pulse and turns on low-side switch until inductor drops below the valley current limit, and then turns on high-side again to maintain output voltage and supports loading current to output before triggering UVP.

If the OCP condition keeps and the load current is larger than the current which converter can provide, the output voltage will decrease and drop below UVP threshold, and the converter will keep switching for 16 consecutive cycles before entering hiccup operation. The converter latches off 1.7ms when the output voltage is still lower than UVP threshold, and the soft-start sequence begins again after latching off time.

Soft-Start

An internal current source charges an internal capacitor to build the soft-start ramp voltage. The typical soft-start time can be programmed by I²C.

Figure 2. Start-Up Sequence

Over-Temperature Protection (OTP)

The RT5742 includes an over-temperature protection (OTP) circuitry to prevent overheating due to excessive power dissipation. If the junction temperature rises above the over-temperature threshold of 150°C (typical), the device will shut down. Once the junction temperature cools down by a thermal shutdown hysteresis ($\Delta T_{SD} = 15^\circ C$), the IC will resume normal operation with a complete soft-start.

Overvoltage Behavior (OV)

The RT5742 provides a natural overvoltage protection function to prevent damage behavior during heavy load released scenario.

When device is set at auto PFM/PWM operation, the high-side and low-side MOSFET will automatically turn off immediately as long as output voltage rises above internal reference target. When the output voltage goes below the target, the internal comparator will trigger on-time controller to resume switching behavior to maintain excellent regulation.

When device is configured as FCCM operation mode, the high-side and low-side MOSFET will continuously switch to regulate the output voltage back to target setting.

Application Information

Richtek's component specification does not include the following information in the Application Information section. Thereby no warranty is given regarding its validity and accuracy. Customers should take responsibility to verify their own designs and reserve suitable design margin to ensure the functional suitability of their components and systems.

The basic RT5742 application circuit is shown in Typical Application Circuit. External component selection is determined by the maximum load current and begins with the selection of the inductor value and operating frequency followed by C_{IN} and C_{OUT}.

Inductor Selection

The inductor value and operating frequency determine the ripple current according to a specific input and output voltage. The ripple current, ΔI_L, increases with higher V_{IN} and decreases with higher inductance, as shown in the equation below:

$$\Delta I_L = \left[\frac{V_{OUT}}{f \times L} \right] \times \left[1 - \frac{V_{OUT}}{V_{IN}} \right]$$

where f is the operating frequency and L is the inductance.

To optimize the loop stability, 0.33μH is strongly recommended. Suppose the higher inductance is chosen, the transient performance may become worse; in the opposite situation, the lower inductance causes larger ripple, and there is a risk of reaching negative overcurrent protection during VID down.

Input and Output Capacitor Selection

An input capacitor, C_{IN}, is needed to filter out the trapezoidal current at the source of the high-side MOSFET.

To prevent large ripple current, a low ESR input capacitor sized for the maximum RMS current should be used. The RMS current is given by:

$$I_{RMS} = I_{OUT(MAX)} \times \frac{V_{OUT}}{V_{IN}} \times \sqrt{\frac{V_{IN}}{V_{OUT}} - 1}$$

This formula has a maximum at V_{IN} = 2V_{OUT}, where I_{RMS} = I_{OUT(MAX)}/2.

This simple worst-case condition is commonly used for design.

Choose a capacitor rated at a higher temperature than required. Several capacitors may also be paralleled to meet the size or height requirements of the design. Ceramic capacitors have high ripple current, high voltage rating and low ESR, which makes them ideal for switching regulator applications. However, they can also have a high voltage coefficient and audible piezoelectric effects. The high Q of ceramic capacitors with trace inductance can lead to significant ringing. When a ceramic capacitor is used at the input and the power is supplied by a wall adapter through long wires, a load step at the output can induce ringing at the input, V_{IN}. At best, this ringing can couple to the output and be mistaken as loop instability. At worst, a sudden inrush of current through the long wires can potentially cause a voltage spike at V_{IN} large enough to damage the part. Thus, care must be taken to select a suitable input capacitor.

The selection of C_{OUT} is determined by the required ESR to minimize output voltage ripple. Moreover, the amount of bulk capacitance is also a key for C_{OUT} selection to ensure that the control loop is stable. Loop stability can be checked by viewing the load transient response.

The output voltage ripple, ΔV_{OUT}, is determined by:

$$\Delta V_{OUT} \leq \Delta I_L \left[ESR + \frac{1}{8 \times f_{SW} \times C_{OUT}} \right]$$

where f_{SW} is the switching frequency and ΔI_L is the inductor ripple current. The output voltage ripple will be the highest at the maximum input voltage since ΔI_L increases with input voltage. Multiple capacitors placed in parallel may be needed to meet the ESR and RMS current handling requirement.

Ceramic capacitors have excellent low ESR characteristics, but can have a high voltage coefficient and audible piezoelectric effects. The high Q of ceramic capacitors with trace inductance can also lead to significant ringing.

Nevertheless, high value, low cost ceramic capacitors are now becoming available in smaller case sizes. Their high ripple current, high voltage rating and low ESR make them ideal for switching regulator applications.

I²C Interface Function

The RT5742 can be managed by I²C interface to select V_{OUT} voltage level, Dynamic Voltage Scaling (DVS) slew rate, Auto PFM/PSM or Forced PWM mode, and so on.

The register of each function can be found from the register map in Table 3, which also explains how to use these functions.

V_{OUT} Selection

The RT5742 has programmable V_{OUT} from 0.3V to 1300mV with 5mV resolution.

The output voltage can be set by NSELx register bit and the output voltage is given by the following equation:

$$V_{OUT} = 0.3V + NSELx \times 5mV$$

For example:

if NSELx = 0111100 (60 decimal), then

$$\begin{aligned} V_{OUT} &= 0.3 + 60 \times 5mV \\ &= 0.3 + 0.3 = 0.6V. \end{aligned}$$

The RT5742 also has external VSEL pin to select NSEL1(0X01) or NSEL0(0X00). Pulling VSEL to high is for VSEL1 and pulling VSEL to low is for VSEL0.

Upon POR, VSEL0 and VSEL1 are reset to their default voltages.

Enable and Soft-Start

When the EN pin is LOW, the IC is shut down, all internal circuits are off, and the part draws very little current. In this state, I²C cannot be written to or read until enable voltage is above the enable rising threshold. The registers are reset when the EN pin is LOW or during a Power On Reset (POR).

Once the EN pin is high, V_{OUT} will ramp up at the chosen soft-start slew rate programmed in the CONTROL2 register SS_SR bit.

Discharge Function

In the CONTROL1 register, setting the DISCHG bit to 1 can make V_{OUT} discharge by internal resistor when the converter shuts down. If the DISCHG bit is set to 0, V_{OUT} will decrease depending on the loading. When EN pin is set to low, the RT5742 turns on 10Ω discharge resistor by default.

Slew Rate Setting

The RT5742 can control slew rate as V_{OUT} changes between two voltage levels for both up and down.

The UP_SR bits in the CONTROL1 register control up-speed, whereas the DN_SR bits in the CONTROL2 register control down-speed. The default DVS up slew rate is 12mV/μs and DVS down slew rate is 3mV/μs.

Forced PWM Mode

The MODE_VSEL0 and MODE_VSEL1 bits in CONTROL1 register can determine the operation mode of the converter. Set 1 for Forced PWM operation and set 0 for auto PSM/PWM operation. Note that, MODE_VSEL0 is activated only when pulling VSEL pin to low, and only set VSEL pin to high for VSEL1 so that the setting of MODE_VSEL1 can be activated.

During dynamic voltage scaling from high setting of output voltage to low setting, the RT5742 makes transient in Forced PWM mode, and output voltage will decrease quickly.

The RT5742 is able to support fast mode I²C interface (bit rate 400kb/s). The RT5742 default I²C slave address is 7'b1010000. The write or read bit stream (N ≥ 1) is shown below:

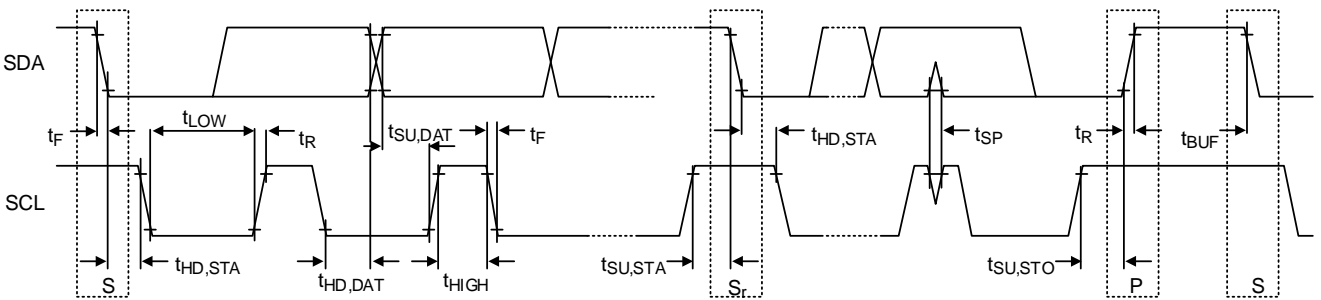

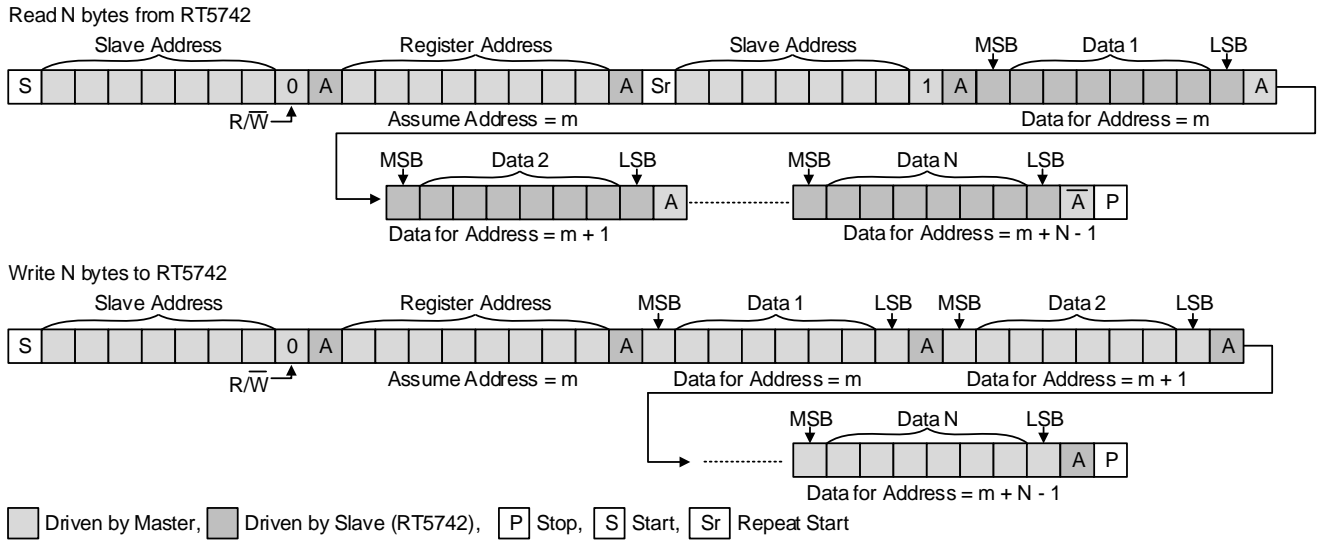

Figure 3. I²C Read and Write Stream and Timing Diagram

The RT5742 also supports High-speed mode (bit rate up to 3.4Mb/s) with access code 08H. Figure 4 and Figure 5 show detailed transfer format. Hs-mode can only commence after the following conditions (all of which are in F/S-mode):

- ▶ START condition (S)
- ▶ 8-bit master code (00001xxx)
- ▶ not-acknowledge bit (\bar{A})

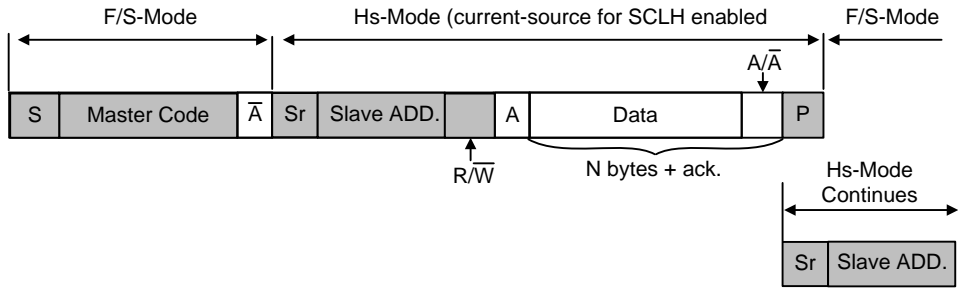

Figure 4. Data Transfer Format in Hs-mode

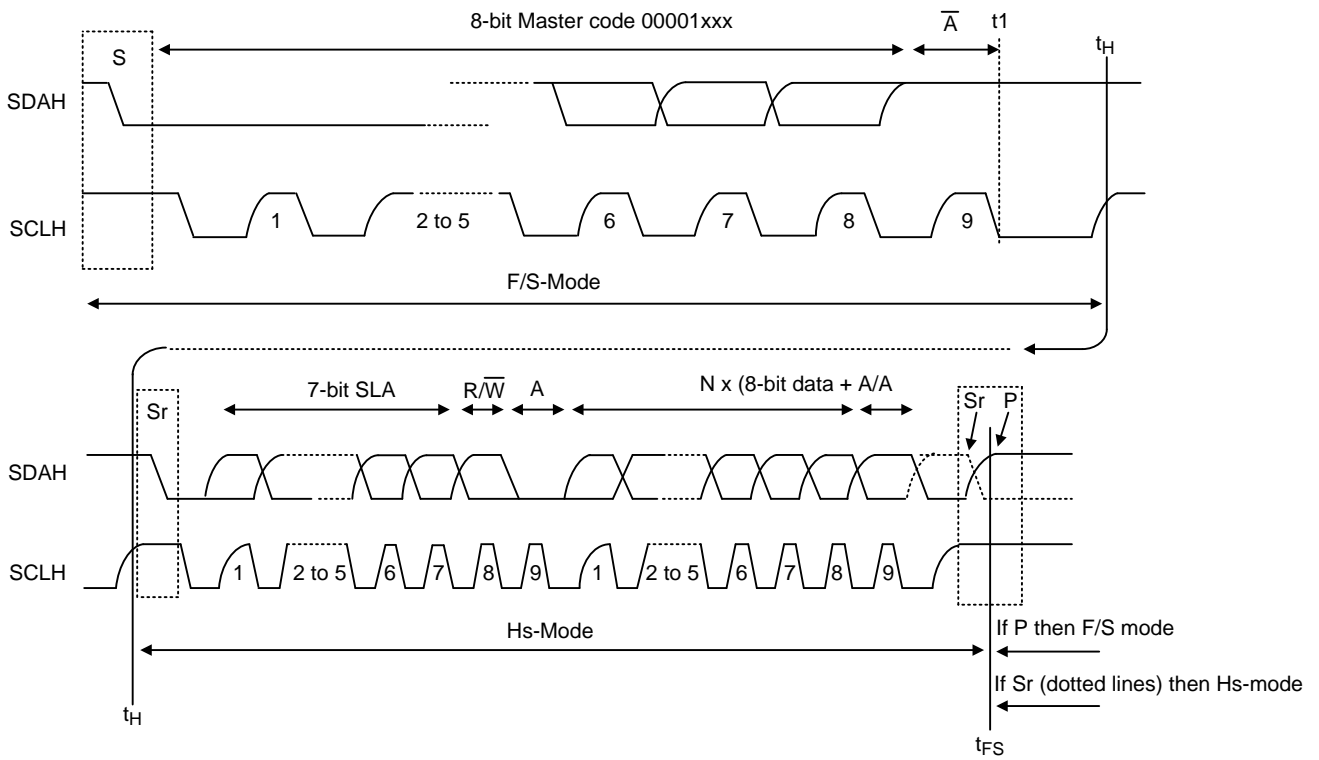

Figure 5. A Complete Hs-mode Transfer

Thermal Considerations

The junction temperature should never exceed the absolute maximum junction temperature $T_{J(MAX)}$, listed under Absolute Maximum Ratings, to avoid permanent damage to the device. The maximum allowable power dissipation depends on the thermal resistance of the IC package, the PCB layout, the rate of surrounding airflow, and the difference between the junction and ambient temperatures. The maximum power dissipation can be calculated using the following formula:

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

where $T_{J(MAX)}$ is the maximum junction temperature, T_A is the ambient temperature, and θ_{JA} is the junction-to-ambient thermal resistance.

For continuous operation, the maximum operating junction temperature indicated under Recommended Operating Conditions is 125°C. The junction-to-ambient thermal resistance, $\theta_{JA(EVB)}$, is highly package dependent. For a WL-CSP-11B 1.31x1.62 (BSC) package, the thermal resistance, $\theta_{JA(EVB)}$, is 65.4°C/W on a high effective-thermal-conductivity four-layer test board. The maximum power dissipation at $T_A = 25^\circ\text{C}$ can be calculated as below:

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ) / (65.4^\circ\text{C/W}) = 1.53\text{W for a WL-CSP-11B 1.31x1.62 (BSC) package.}$$

The maximum power dissipation depends on the operating ambient temperature for the fixed $T_{J(MAX)}$ and the thermal resistance, $\theta_{JA(EVB)}$. The derating curves in Figure 6 allows the designer to see the effect of rising ambient temperature on the maximum power dissipation.

Figure 6. Derating Curve of Maximum Power Dissipation

Layout Considerations

For best performance of the RT5742, the following layout guidelines must be strictly followed.

- ▶ Input capacitor must be placed as close as possible to IC to minimize the power loop area. A typical 0.1µF decoupling capacitor is recommended to reduce power loop area and any high frequency component on VIN.
- ▶ SW node is with high frequency voltage swing, so the SW node area should be kept small. Keep analog components away from the SW node to prevent stray capacitive noise pickup.
- ▶ Keep every power trace connected to pin as wide as possible for improving thermal dissipation.
- ▶ The AGND pin is suggested to connect to the 2nd GND plate through the top to the 2nd via.
- ▶ Keep the feedback line need as short as possible and away from power inductor, especially from surrounding the inductor.

An example of PCB layout guide is shown in Figure 7Figure 7Figure 7.

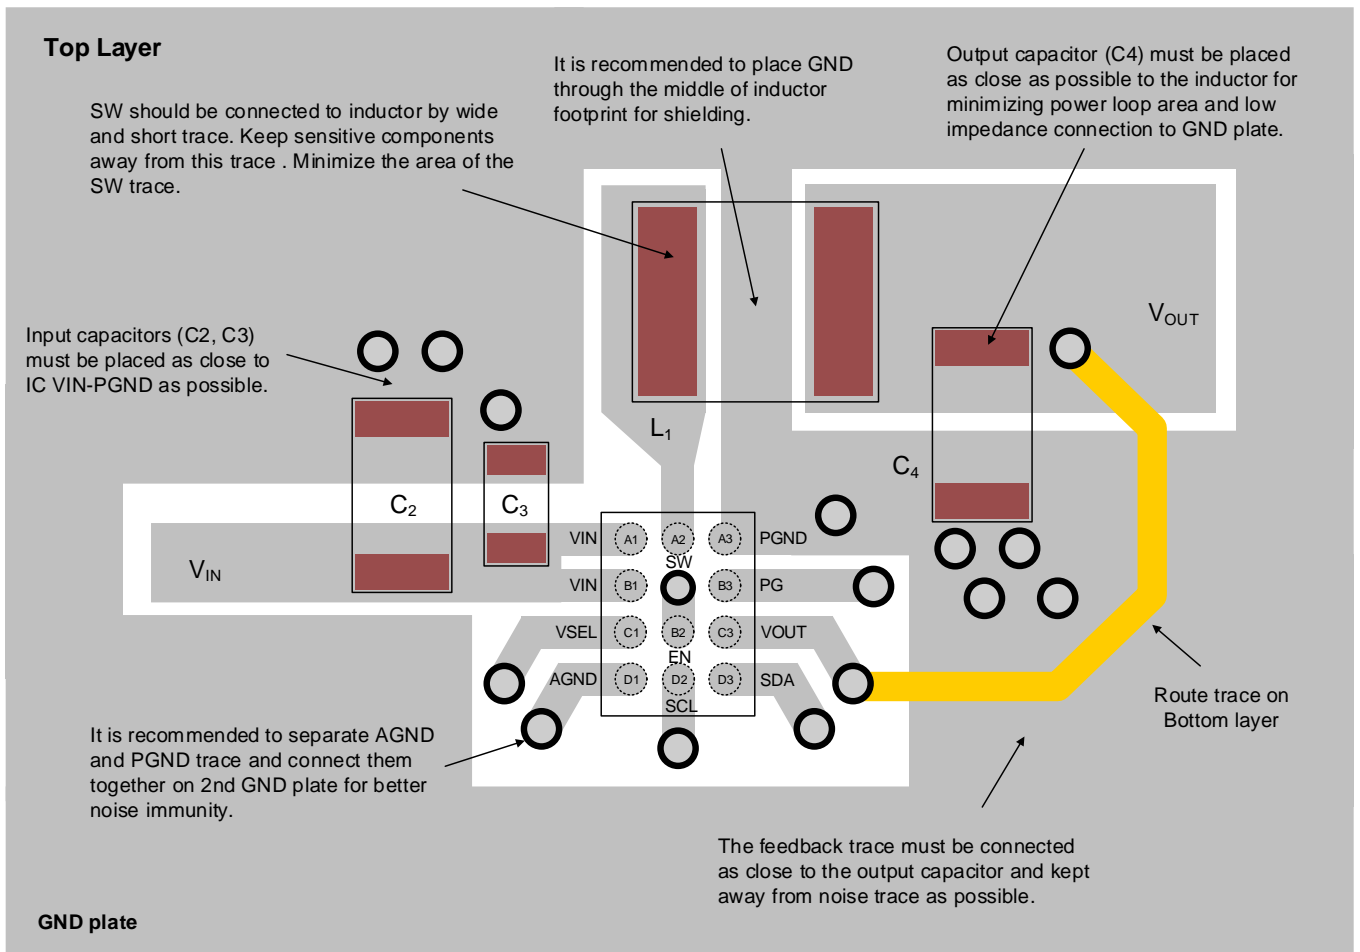

Figure 7. PCB Layout Guide

Functional Register Description

The RT5742 I²C slave address is 7'b1010100 for 0.5V/0.3V setting.

Table 3. I²C Register Map

Register Name	Address	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Default	Type
