

# Automotive CIS/CCM PMIC for Ultra Compact Camera and High Image Quality System

## 1 General Description

The RTQ2072A-QT/RTQ2072B-QT is a highly integrated PMIC designed for automotive camera applications. It includes three buck converters and one high PSRR low-dropout (LDO) regulator. The high-voltage buck converter operates with an input voltage range of up to 18.5V, suitable for Power Over Coax (POC) connections. Two low-voltage buck converters provide a constant output voltage. All buck converters operate in a forced fixed-frequency PWM mode.

The LDO output voltage can be easily set via an external resistor. The RTQ2072A-QT/RTQ2072B-QT supports 10 power sequences, configurable through a resistor. The ICQ is available in a WETD-VQFN-16L 3x3 package with dimple lead type wettable flanks.

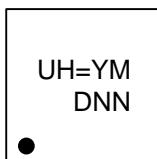

The recommended junction temperature range is  $-40^{\circ}\text{C}$  to  $150^{\circ}\text{C}$  and the recommended ambient temperature range is  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ .

## 2 Applications

- Automotive Camera Modules
  - Surround View Cameras
  - Front View Cameras
  - Rear View Cameras
  - Dash Cam DVR
  - Driver Monitoring Systems
  - Cabin Monitors
  - E-mirrors

## 3 Marking Information

RTQ2072BAGQVT-QT-11

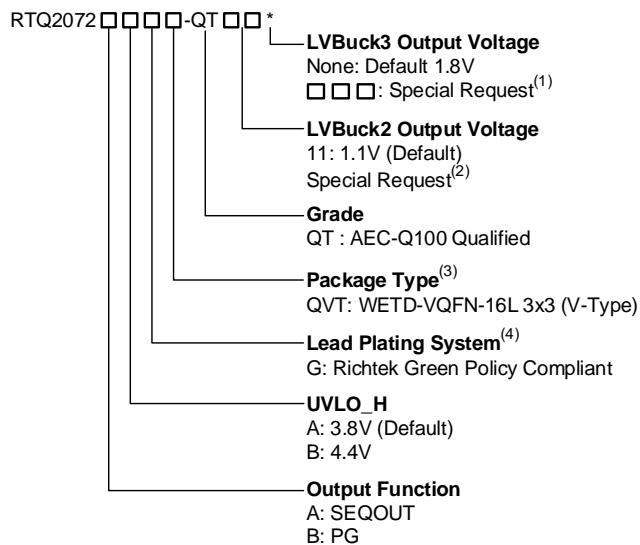

UH= : Product Code  
YMDNN : Date Code

## 4 Features

- AEC-Q100 Grade 1 Qualified
- FMEA Compliant Pin Placement and Protection Mechanisms
- Three Buck Converters (HVBuck1, LVBUCK2, and LVBUCK3)
  - Peak Current Mode PWM Operation
  - Fixed Switching Frequency at 2.1MHz
  - EMI Reduction Features including Spread Spectrum and Phase Shift Operation
  - HVBuck1 Supports Input Voltage from 4V to 18.5V, Adjustable Output Voltage, and up to 2A Output Current
  - LVBUCK2 Supports Input Voltage from 2.7V to 5V, Fixed Output Voltage, and 1.5A Output Current
  - LVBUCK3 Supports Input Voltage from 2.7V to 5V, Fixed Output Voltage, and 750mA Output Current
  - Pins Related to LVBUCK2/LVBUCK3 Can Float if the Channel is Unused
- Low Dropout Regulator (LDO)
  - Input Voltage from 2.7V to 5V and 300mA Output Current
  - 10 Adjustable Output Voltage Settings via the RSET Pin
  - High PSRR: 60dB at 100kHz, 40dB at 1MHz
- Output Function
  - Sequence Control for External Power IC via SEQOUT (RTQ2072A-QT)
  - Power Status Indication via PG (RTQ2072B-QT)
- 10 Flexible Power Sequence Settings via the SEQ Pin
- Small Form Factor WETD-VQFN-16L 3x3 Wettable Flanks Package

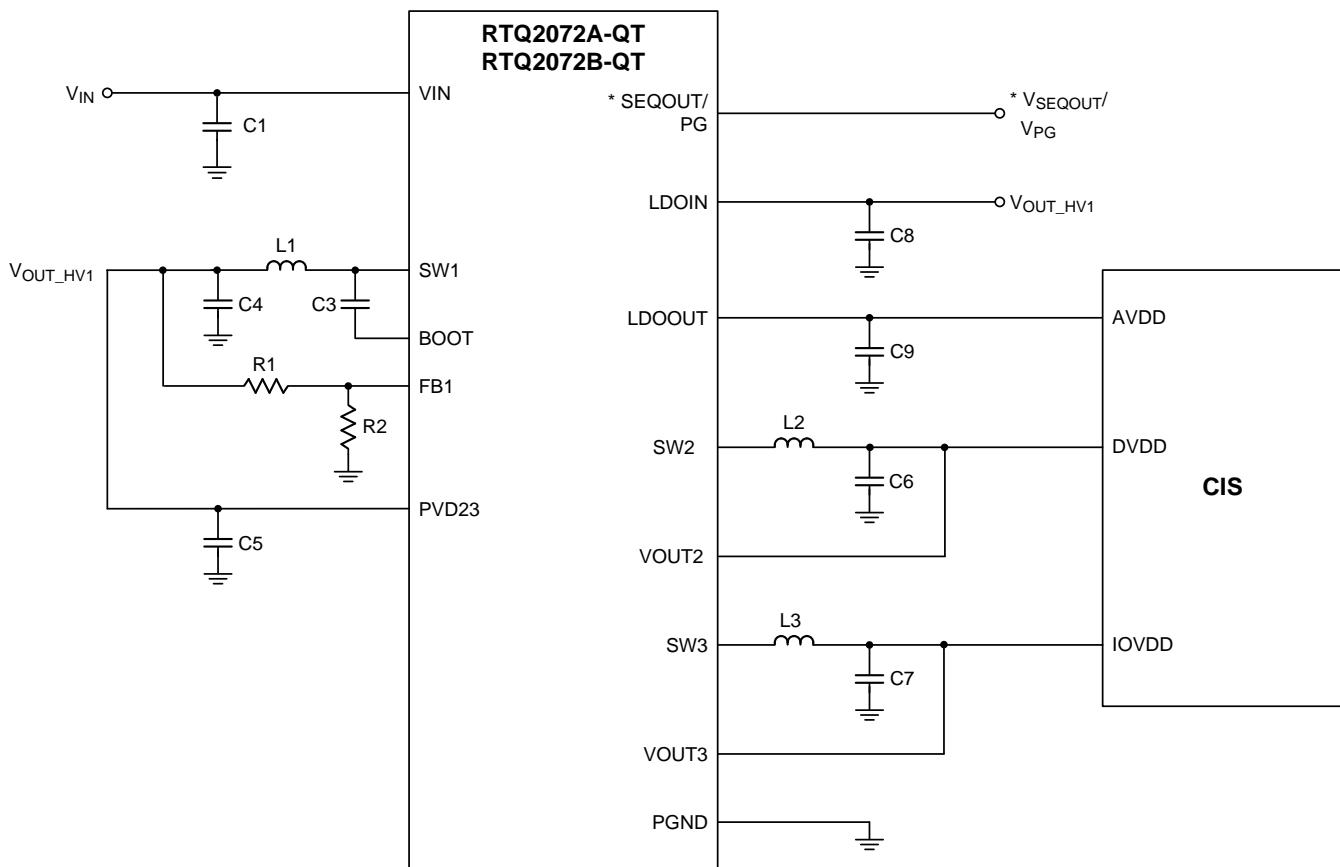

## 5 Ordering Information

### Note 1.

- Marked with <sup>(1)</sup> indicated: Special Request: For example, 095 means 0.95V.
- Marked with <sup>(2)</sup> indicated: Special Request: Available voltage between 0.6V to 2.1V with 100mV step under specific business agreement.
- Marked with <sup>(3)</sup> indicated: Compatible with the current requirements of IPC/JEDEC J-STD-020.
- Marked with <sup>(4)</sup> indicated: Richtek products are Richtek Green Policy compliant.

## 6 Simplified Application Circuit

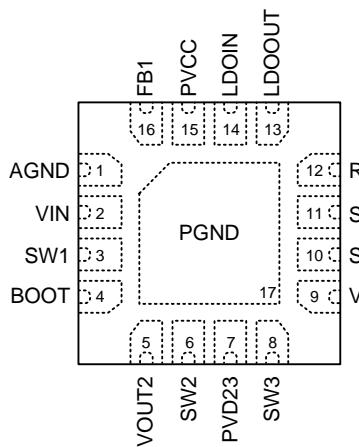

**Note 2.** The SEQOUT pinout is for the RTQ2072A-QT; the PG pinout is for the RTQ2072B-QT.

## 7 Pin Configuration

(TOP VIEW)

WETD-VQFN-16L 3x3 (RTQ2072A-QT)

WETD-VQFN-16L 3x3 (RTQ2072B-QT)

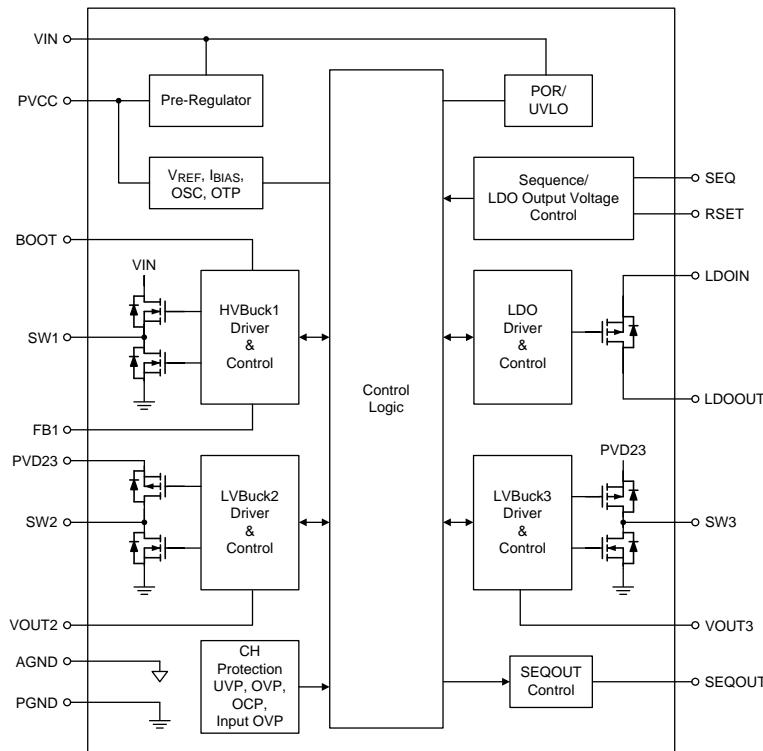

## 8 Functional Pin Description

Pin No.	Pin Name	Pin Function
1	AGND	Analog ground.
2	VIN	Supply voltage input of HV Buck1. Connect a 4.7µF or larger decoupling ceramic capacitor between this pin and ground.
3	SW1	HV Buck1 switch node.
4	BOOT	Bootstrap capacitor connection pin for HV Buck1. Connect a 0.1µF ceramic capacitor between this pin and SW1.
5	VOUT2	Output voltage feedback input of LV Buck2. Directly connect the output capacitor node to this pin for better regulation.
6	SW2	LV Buck2 switch node.
7	PVD23	Supply voltage input of LV Buck2 and LV Buck3. Connect a 4.7µF or larger decoupling ceramic capacitor between this pin and ground.
8	SW3	LV Buck3 switch node.
9	VOUT3	Output voltage feedback input of LV Buck3. Directly connect the output capacitor node to this pin for better regulation.
10	SEQ	Power sequence selection.
11	SEQOUT	Sequence control output with open drain structure for external power IC. (RTQ2072A-QT)
	PG	Power status indication pin with open-drain structure for HV Buck1, LV Buck2, LV Buck3 and LDO. PG at high state indicates all outputs work well. (RTQ2072B-QT)
12	RSET	LDO output voltage selection.
13	LDOOUT	LDO output. Connect a 2.2µF ceramic decoupling capacitor between this pin and ground.

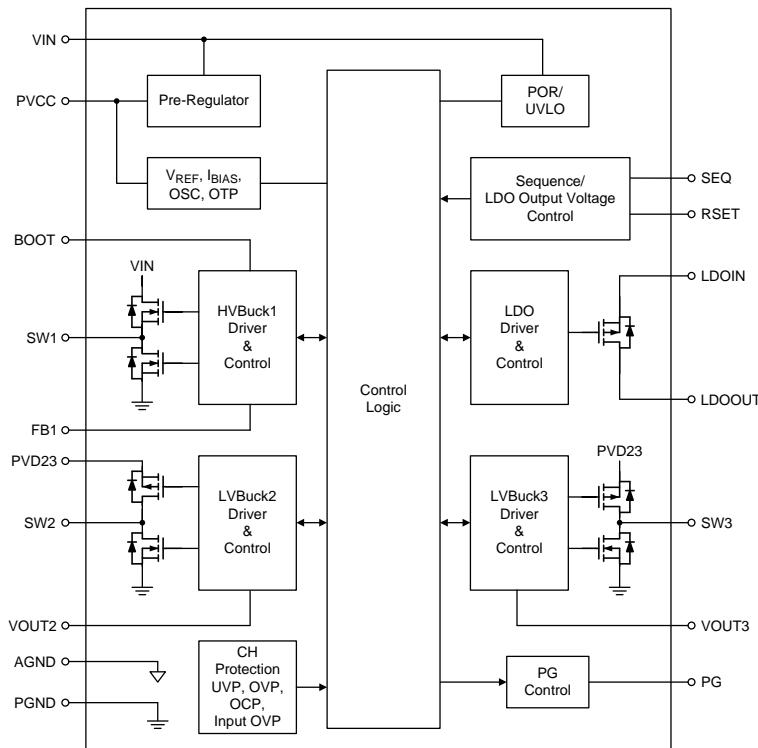

Pin No.	Pin Name	Pin Function
14	LDOIN	Supply voltage input of LDO. Connect a 2.2 $\mu$ F or larger decoupling ceramic capacitor between this pin and ground.
15	PVCC	Internal analog power output. Connect a 1 $\mu$ F ceramic decoupling capacitor between this pin and ground. Note additional external loading on this pin is forbidden.
16	FB1	Output voltage feedback input of HV Buck1.
17 (Exposed Pad)	PGND	IC thermal pad and power ground. It must connect to main ground plane for proper operation.

## 9 Functional Block Diagram

### 9.1 RTQ2072A-QT

### 9.2 RTQ2072B-QT

## 10 Absolute Maximum Ratings

([Note 3](#))

• VIN -----	-0.3V to 24V
• SW1 -----	-0.3V to 24V
• BOOT -----	-0.3V to 28V
• BOOT to SW1 -----	-0.3V to 5V
• VOUT2, PVD23, VOUT3, SEQ, SEQOUT (RTQ2072A-QT), PG (RTQ2072B-QT), RSET, LDOOUT, LDOIN, PVCC, FB1 -----	-0.3V to 6.5V
• SW2, SW3 -----	-0.3V to 6.5V
• Power Dissipation, PD @ TA = 25°C WETD-VQFN-16L 3x3 -----	4.16W
• Package Thermal Resistance ( <a href="#">Note 4</a> )	
WETD-VQFN-16L 3x3, θJA -----	30°C/W
WETD-VQFN-16L 3x3, θJC -----	4.4°C/W
• Lead Temperature (Soldering, 10 sec.)-----	260°C
• Junction Temperature -----	150°C
• Storage Temperature Range -----	-65°C to 150°C
• ESD Susceptibility ( <a href="#">Note 5</a> )	
HBM (Human Body Model) -----	2kV

**Note 3.** Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

**Note 4.** θ<sub>JA</sub> is simulated under natural convection (still air) at T<sub>A</sub> = 25°C with the component mounted on a high effective-thermal-conductivity four-layer test board on a JEDEC 51-7 thermal measurement standard. θ<sub>JC</sub> is simulated at the bottom of the package.

**Note 5.** Devices are ESD sensitive. Handling precautions are recommended.

## 11 Recommended Operating Conditions

([Note 6](#))

• Supply Voltage, VIN -----	4V to 18.5V
• Supply Voltage, VPVD23, VLDOIN -----	2.7V to 5V
• Ambient Temperature Range -----	-40°C to 125°C
• Junction Temperature Range -----	-40°C to 150°C

**Note 6.** The device is not guaranteed to function outside its operating conditions.

## 12 Electrical Characteristics

( $T_A = T_J = -40^\circ\text{C}$  to  $125^\circ\text{C}$ ,  $V_{IN} = 6\text{V}$ ,  $V_{OUT\_HV1} = 3.6\text{V}$ ,  $V_{OUT\_LV2} = 1.1\text{V}$ ,  $V_{OUT\_LV3} = 1.8\text{V}$ ,  $V_{OUT\_LDO} = 3.3\text{V}$ , unless otherwise specified.)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
<b>System</b>						
Undervoltage-Lockout Threshold	VUVLO_H	$V_{IN}$ rising	3.6	3.8	4	V

	COUT_LV3		4.5	10	14	
	COUT_LDO		0.7	2.2	4	
Output Inductance	LHV1		1	1.5	2	μH
	LLV2		0.68	1	1.2	
	LLV3		0.68	1	1.2	
Effective Boot Capacitance	CBOOT		0.07	0.1	0.13	μF
Effective PVCC Capacitance	CPVCC		0.3	1	1.4	μF

**Note 7.** The Dropout voltage is the voltage difference between the input and the output at which the output voltage drops to 100 mV below its nominal value.

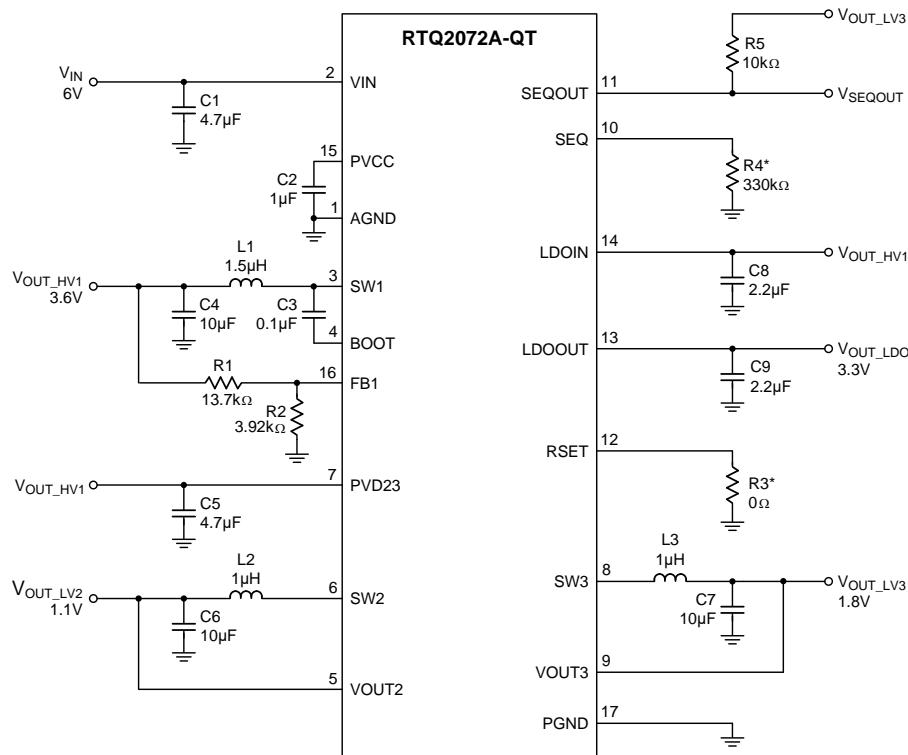

**Note 8.** It only supports LDO loading smaller than 150mA (typical) to power up successfully. The current limit changes back to 450mA after LDO rail enabled after 8ms.

**Note 9.** PVCC is the pre-regulator output voltage only for internal circuitry. External loading on the PVCC pin is forbidden.

**Note 10.** The tss\_LDO depends on LDO total output capacitance. It can calculate the soft-start time without loading condition as formula:  $tss_{LDO} = (COUT_{LDO} \times VOUT_{LDO}) / 0.15$ .

**Note 11.**

R3: The resistor is adjustable with different LDO output voltages.

R4: The resistor is adjustable with different power-on sequences.

## 14 Typical Operating Characteristics

## 15 Operation

The RTQ2072A-QT/RTQ2072B-QT is a highly integrated power management integrated circuit (PMIC) for automotive camera system. It includes three buck converters (CH1 HV Buck1, CH2 LV Buck2, CH3 LV Buck3) and one generic LDO (CH4 LDO).

### 15.1 System Undervoltage Protection and Overvoltage Protection

The RTQ2072A-QT/RTQ2072B-QT stops operating if the VIN voltage falls below the Undervoltage Lockout level (UVLO\_L). A typical 500mV hysteresis is implemented to avoid unstable on/off behaviors. The shift values of UVLO\_H and UVLO\_L both move in the same direction (either positive or negative at the same time). The device is initialized to its default state after VIN voltage recovering from UVLO\_H. When the VIN voltage reaches the overvoltage protection level, the buck converters, LDO, and SEQOUT (RTQ2072A-QT) are disabled immediately. The IC then enters latch-off state and can only be re-started by toggling the VIN power. Meanwhile, the PG status will be set to 0V to indicate an IC fault condition.

### 15.2 Over-Temperature Protection

The RTQ2072A-QT/RTQ2072B-QT features over-temperature protection (OTP). When the junction temperature exceeds the typical threshold of 160°C, OTP is activated, disabling all outputs as the device enters a latch-off state. Once the RTQ2072A-QT/RTQ2072B-QT recovers from OTP, the device can only be re-started by toggling the VIN power.

### 15.3 Pre-Regulator

The device integrates a 4.45V linear regulator (PVCC) supplied by VIN to provide power to the internal circuitry. The PVCC can be used as the pull-up supply for the RSET and SEQ pins, but it is “NOT” allowed to power any other device or circuitry. A 1 $\mu$ F decoupling capacitor must be connected between PVCC and AGND to filter noise and it should be placed as close as possible to the PVCC pin.

### 15.4 Peak Current Mode Control

The three buck converters utilize the peak current mode control. An internal oscillator initiates the turn-on of the high-side MOSFET switch. At the beginning of each clock cycle, the internal high-side MOSFET switch turns on, allowing current to ramp up in the inductor. By comparing the inductor peak current signal during the high-side MOSFET switch on interval with the internal compensation signal derived from the sensed feedback voltage and reference voltage, the high-side MOSFET switch is turned off and the inductor current continues to flow through the low-side MOSFET switch. This cycle repeats at the next clock cycle. In this way, the regulated inductor current controls duty-cycle and output voltage of the converter.

### 15.5 Spread-Spectrum Operation

The periodic nature of switching signals tends to concentrate energy at specific frequencies and their harmonics, which can be radiated and potentially cause EMI issues. To address this, the RTQ2072A-QT/RTQ2072B-QT incorporates a spread-spectrum function to meet CISPR and automotive EMI compliances requirements. The spread-spectrum function utilizes a pseudo-random sequence to modulate the switching frequency by +6%. For example, with a typical switching frequency of 2.1 MHz, the frequency range varies from 2.1MHz to 2.226MHz. This ensures that the 2.1MHz switching frequency does not fall within the 1.8MHz AM band limit, thereby minimizing the risk of EMI problems.

### 15.6 Phase-Shifted Operation

The RTQ2072A-QT/RTQ2072B-QT supports phase-shifted operation to prevent all buck converters from switching simultaneous, thereby further reducing the radiation energy. The internal clock is automatically shifted to different respective sub-clocks for buck converters. For example, in a two-buck converter application, the turn-on times of the high-side MOSFETs are offset by 180 degrees. In three-buck converter application, the phase difference is 120 degrees between each converter.

### 15.7 Allowable Channel Floating

To save PCB layout space and reduce material costs, the unused low-voltage buck converters (CH2/CH3) can be left with floating pins (SW2/SW3), eliminating the need for inductors and output capacitors. The PVD23 pin must be connected to a fixed voltage for floating detection, and it is permissible to omit the capacitor placement. The RTQ2072A-QT/RTQ2072B-QT automatically detects the pin status during the power-on procedure to determine whether the channel is used. After this detection, any malfunction in an unused channel will not impact the device's operation.

**Table 2. Unused Channel Pin Connection**

Unused Channel	Unused Pin Number	Unused Pin Name	Pin Configuration
LVBuck2	5	VOUT2	Floating
	6	SW2	Floating
	7	PVD23	Connect to a fixed voltage
LVBuck3	7	PVD23	Connect to a fixed voltage
	8	SW3	Floating
	9	VOUT3	Floating

### 15.8 Power-Good Indication

The RTQ2072B-QT features an open-drain power-good output (PG) to monitor the output voltage status. Connect a pull-up resistor from the PG pin to an external voltage. Note that it is forbidden to use PVCC as the pulled-up voltage for the PG pin. When the last channel in the power-on sequence reaches 90% of its target output voltage, the PG signal is pulled high to indicate a "Power-Good" status after a 10ms delay, until the device is disabled or any other protection is triggered.

### 15.9 External Control Output

The RTQ2072A-QT provides an open-drain external control output (SEQOUT) for external devices. To use this function, connect a pull-up resistor from the SEQOUT pin to an external voltage. Note: Do not use PVCC as the pull-up voltage for the SEQOUT pin. For detailed information regarding the power-on sequence, refer to [Table 3](#).

## 16 Application Information

([Note 13](#))

### 16.1 Power Sequence Control

The RTQ2072A-QT/RTQ2072B-QT supports 10 power-on sequences for the buck converters and LDO via the dedicated resistor on SEQ pin. SEQ pin is not allowable at floating state and resistance selected out of range is not guaranteed to correct power-on sequence. In addition, there is only simultaneous power-off for all outputs. To fix the resistor selection on SEQ pin before enabling the device. Any change during the power on procedure is not guaranteed to the correct power-on sequence. Below table shows the power-on sequence with its corresponding resistance.

**Table 3. Power-On Sequence Control**

SEQ No.	Resistance on SEQ ( $\Omega$ )			Sequence				
	Min	Typ	Max	CH1	CH4	CH3	CH2	SEQOUT
SEQ0	1.07M	1.1M	1.13M	CH1	CH4	CH3	CH2	SEQOUT
SEQ1	319k	330k	341k	CH1	CH2	CH3	SEQOUT	CH4
SEQ2	164k	169k	174k	CH1	CH2	SEQOUT	CH3	CH4
SEQ3	81.6k	84.5k	87.4k	CH1	SEQOUT	CH2	CH4	CH3
SEQ4	45.4k	47k	48.6k	CH1	CH2, CH3, CH4, SEQOUT			
SEQ5	26.1k	27k	27.9k	CH1, CH2, CH3, CH4, SEQOUT				
SEQ6	14.5k	15k	15.5k	CH1	CH3	CH2	CH4	SEQOUT
SEQ7	7.78k	8.06k	8.34k	CH1	CH3	CH4	CH2	SEQOUT
SEQ8	Short to PVCC			CH1	SEQOUT	CH2	CH3	CH4
SEQ9	Short to PGND			CH1	CH2	CH3	CH4	SEQOUT

**Note 12.**

1. The SEQOUT output exists only in the RTQ2072A-QT. After the SEQOUT output high state 1ms passed, the next channel continues to proceed power on sequence.
2. For RTQ2072B-QT, 1ms time interval will substitute the SEQOUT output. Below is the SEQ1 example.

For RTQ2072A-QT, CH1 → CH2 → CH3 → SEQOUT → CH4

For RTQ2072B-QT, CH1 → CH2 → CH3 → 1ms → CH4

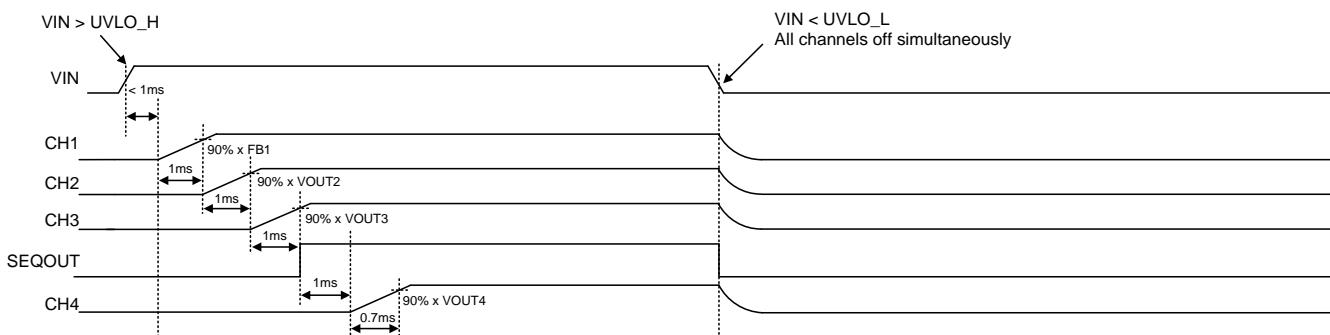

Figure 1. Example SEQ1 for RTQ2072A-QT

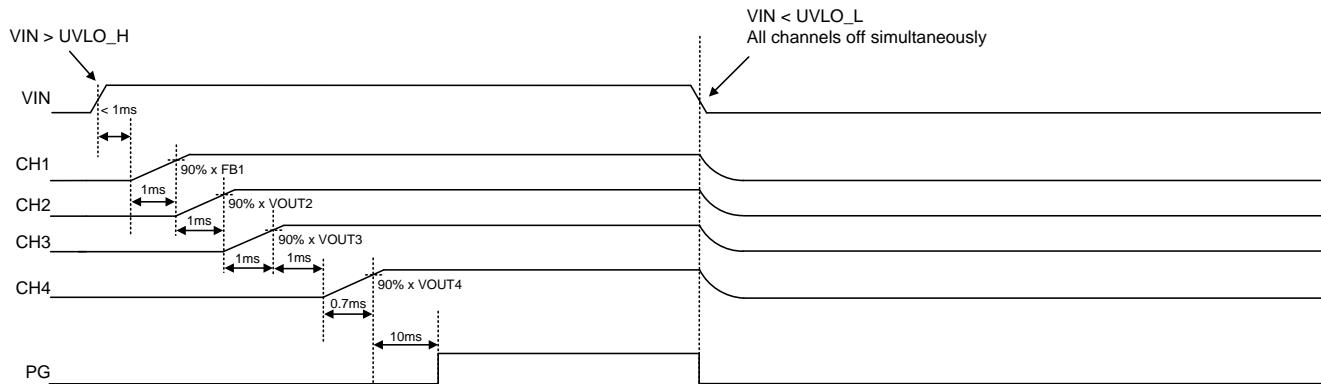

Figure 2. Example SEQ1 for RTQ2072B-QT

## 16.2 Output Voltage Setting

The section describes how to set the output voltages for each channel.

### 16.2.1 HVBuck1

The output voltage set by external feedback resistors is expressed in the following equation:

$$V_{OUT\_HV1} = \left(1 + \frac{R1}{R2}\right) \times V_{FB1}$$

where the reference voltage  $V_{FB1}$  is 0.8V (typical).

The placement of the resistive divider should be as close as possible to the FB1 pin. For better output voltage accuracy, the divider resistors with  $\pm 1\%$  tolerance or better should be used. The recommended resistance ranges from a few  $k\Omega$  to hundreds of  $k\Omega$ .

### 16.2.2 LVBUCK2 and LVBUCK3

The output voltage of LVBUCK2 is fixed at 1.1V.

The output voltage of LVBUCK3 is fixed at 1.8V.

### 16.2.3 LDO

The LDO output voltage is controlled by setting the dedicated resistor on the RSET pin. The RSET pin must not be left floating, and resistance selected out of range is not guaranteed to result in the correct output voltage. Changing the output voltage in real-time is not recommended. Ensure the resistor selection on the RSET pin is fixed before enabling the device.

**Table 4. LDO Output Voltage**

RSET No.	Resistor on REST ( $\Omega$ )			Voltage (V)
	Min	Typ	Max	
RSET0	1.07M	1.1M	1.13M	3.5
RSET1	319k	330k	341k	3.4
RSET2	164k	169k	174k	3.2
RSET3	81.6k	84.5k	87.4k	3.1
RSET4	45.4k	47k	48.6k	3.0
RSET5	26.1k	27k	27.9k	2.8
RSET6	14.5k	15k	15.5k	2.7
RSET7	7.78k	8.06k	8.34k	1.8
RSET8	Short to PVCC			2.9
RSET9	Short to PGND			3.3

### 16.3 Channel Protection Features

The RTQ2072A-QT/RTQ2072B-QT is equipped with protections to prevent the device from being damaged by abnormal operations or fault conditions (For example, over-load, short-circuit, soldering issues, etc.).

#### 16.3.1 Undervoltage Protection (UVP)

- HV Buck1, LV Buck2, LV Buck3, and LDO

The device disables all channels and enters the latch-off state if a buck converter or LDO output under voltage fault is detected continuously over the deglitch time. The device can only be re-started by toggling the VIN power.

#### 16.3.2 Overvoltage Protection (OVP)

- HV Buck1

When an overvoltage fault is detected at the FB1 pin, the high-side and low-side MOSFETs turn off immediately and auto-recover to switch until the FB1 pin's voltage decreases to the reset level.

- LV Buck2, LV Buck3, and LDO

The device disables all channels when a buck converter or LDO output overvoltage fault is detected continuously over the deglitch time. When the fault is cleared, the device auto-restarts all channels in sequence.

#### 16.3.3 Overcurrent Protection (OCP)

- HV Buck1, LV Buck2, and LV Buck3

The buck converter includes a cycle-by-cycle high-side MOSFET overcurrent protection against the condition where the inductor current increases abnormally, even over the inductor saturation current rating. If an overcurrent condition occurs, the controller will immediately turn off the high-side MOSFET and turn on the low-side MOSFET to prevent the inductor current from exceeding the peak current-limit level. After the inductor current decreases below the valley current limit, the high-side MOSFET resumes switching on. If an overcurrent fault is further detected continuously over the deglitch time, the device disables all channels and enters latch-off state. The device can only be re-started by toggling the VIN power.

- LDO

When the load reaches the current limit threshold, the current sent to the output will be kept at current limit level. If overcurrent fault detected continuously over the deglitch time, the device disables all channels and enters the latch off state and the device only can re-start with VIN ON/ OFF.

#### 16.3.4 Input Overvoltage Protection (OVP)

- LV Buck2, LV Buck3, and LDO

If the input voltage of the buck converters (LV Buck2, LV Buck3) or LDO reaches the overvoltage protection level, the device disables all channels. After the fault is removed, it auto-restarts all channels in sequence.

**Table 5. Protection Behavior**

Channel	Type	Threshold (Typical)	Deglitch Time (Typical)	Protection	Reset and Threshold (Typical)
System	UVLO	VIN ≤ 3.3V (after IC Operation)	32μs	Disable all channels	VIN ≥ 3.8V
	OVP	VIN ≥ 20V	5ms	Disable all channels and then enter latch-off protection	VIN ≤ 3.3V, then VIN ≥ 3.8V

Channel	Type	Threshold (Typical)	Deglitch Time (Typical)	Protection	Reset and Threshold (Typical)
	OTP	T <sub>J</sub> ≥ 160°C	5μs	Disable all channels and then enter latch-off protection	T <sub>J</sub> ≤ 140°C and V <sub>IN</sub> ≤ 3.3V, then V <sub>IN</sub> ≥ 3.8V
CH1 HVBuck1	UVP	V <sub>FB1</sub> ≤ 0.8V x 50%	5μs	Disable all channels and then enter latch-off protection	V <sub>IN</sub> ≤ 3.3V, then V <sub>IN</sub> ≥ 3.8V
	OVP	V <sub>FB1</sub> ≥ 0.8V x 110%	NA	High/Low-side MOSFETs off, low-side MOSFET conditionally ON to charge the BOOT capacitor for driving high-side MOSFET.	V <sub>FB1</sub> < 0.8V x 110%
	OCP	I <sub>L1_peak</sub> ≥ 3A	10ms	Cycle-by-cycle detection If the condition persists for 10ms, disable all channels and then enter latch-off protection	If latch-off protection, V <sub>IN</sub> ≤ 3.3V, then V <sub>IN</sub> ≥ 3.8V
CH2 LVBuck2	UVP	V <sub>OUT_LV2</sub> ≤ 1.1V x 50%	5μs	Disable all channels and then enter latch-off protection	V <sub>IN</sub> ≤ 3.3V, then V <sub>IN</sub> ≥ 3.8V
	OVP	V <sub>OUT_LV2</sub> ≥ 1.1V x 120%	5ms	Disable all channels	V <sub>OUT2</sub> ≤ 1.1V x 110% with deglitch 5ms
	OCP	I <sub>L2_peak</sub> ≥ 2A	10ms	Cycle-by-cycle detection If the condition persists for 10ms, disable all channels then latch-off protection	If latch-off protection, V <sub>IN</sub> ≤ 3.3V, then V <sub>IN</sub> ≥ 3.8V
	Input OVP	V <sub>IN_PVD23</sub> ≥ 5.8V	5μs	Disable all channels	V <sub>IN_PVD23</sub> ≤ 5.22V with deglitch 5μs
CH3 LVBuck3	UVP	V <sub>OUT_LV3</sub> ≤ 1.8V x 50%	5μs	Disable all channels and then enter latch-off protection	V <sub>IN</sub> ≤ 3.3V, then V <sub>IN</sub> ≥ 3.8V
	OVP	V <sub>OUT_LV3</sub> ≥ 1.8V x 120%	5ms	Disable all channels	V <sub>OUT3</sub> ≤ 1.8V x 110% with deglitch 5ms
	OCP	I <sub>L3_peak</sub> ≥ 1.2A	10ms	Cycle-by-cycle detection If the condition persists for 10ms, disable all channels then latch-off protection	If latch-off protection, V <sub>IN</sub> ≤ 3.3V, then V <sub>IN</sub> ≥ 3.8V
	Input OVP	V <sub>IN_PVD23</sub> ≥ 5.8V	5μs	Disable all channels	V <sub>IN_PVD23</sub> ≤ 5.22V with deglitch 5μs
CH4 LDO	UVP	V <sub>OUT_LDO</sub> ≤ V <sub>OUT_LDO setting</sub> x 40%	5μs	Disable all channels and then enter latch-off protection	V <sub>IN</sub> ≤ 3.3V, then V <sub>IN</sub> ≥ 3.8V
	OVP	V <sub>OUT_LDO</sub> ≥ V <sub>OUT_LDO</sub> x 125%	5ms	Disable all channels	V <sub>OUT_LDO</sub> ≤ V <sub>OUT_LDO</sub> x 110% with deglitch 5ms
	OCP	I <sub>OUT_LDO</sub> ≥ 450mA	10ms	Disable all channels and then enter latch-off	V <sub>IN</sub> ≤ 3.3V, then V <sub>IN</sub> ≥ 3.8V

Channel	Type	Threshold (Typical)	Deglitch Time (Typical)	Protection	Reset and Threshold (Typical)
				protection	
	Input OVP	V <sub>IN_LDO</sub> ≥ 5.8V	5μs	Disable all channels	V <sub>IN_LDO</sub> ≤ 5.3V with deglitch 5μs

## 16.4 Input and Output Capacitor Selection

### 16.4.1 HV Buck1, LV Buck2 and LV Buck3

It is recommended at least a 4.7μF input capacitor with a 10μF output capacitor for buck converters. The ripple voltage is an important index for choosing the output capacitor. This portion consists of two parts. One is the product of ripple current with the ESR of the output capacitor, while the other part is formed by the charging and discharging process of the output capacitor. The output ripple can be calculated as below:

$$\Delta V_{OUT\text{Ripple}} = \Delta V_{ESR} + \Delta V_{OUT} = \Delta V_{ESR} + \frac{\Delta I_L}{8 \times C_{OUT} \times f_{SW}}$$

where  $\Delta V_{ESR} = I_{Crms} \times R_{CESR}$

### 16.4.2 LDO

As with any low dropout regulator, careful selection of external capacitors is essential for the stability and performance of the RTQ2072A-QA/RTQ2072B-QA. A 2.2μF capacitor is recommended for both the input and output of the LDO. Adding additional output capacitor can further improve noise suppression; however, it may also result in higher input inrush current when the LDO starts up. This trade-off should be carefully considered during design.

## 16.5 Thermal Considerations

The junction temperature should never exceed the absolute maximum junction temperature T<sub>J(MAX)</sub>, listed under Absolute Maximum Ratings, to avoid permanent damage to the device. The maximum allowable power dissipation depends on the thermal resistance of the IC package, the PCB layout, the rate of surrounding airflow, and the difference between the junction and ambient temperatures. The maximum power dissipation can be calculated using the following formula:

$$P_{D(\text{MAX})} = (T_{J(\text{MAX})} - T_A) / \theta_{JA}$$

where T<sub>J(MAX)</sub> is the maximum junction temperature; T<sub>A</sub> is the ambient temperature; and θ<sub>JA</sub> is the junction-to-ambient thermal resistance.

For continuous operation, the maximum operating junction temperature indicated under Recommended Operating Conditions is 150°C. The junction-to-ambient thermal resistance, θ<sub>JA</sub>, is highly package dependent. For a WETD-VQFN-16L 3x3 package, the thermal resistance, θ<sub>JA</sub>, is 30°C/W on a standard JEDEC 51-7 high effective-thermal-conductivity four-layer test board. The maximum power dissipation at T<sub>A</sub> = 25°C can be calculated as follows:

$$P_{D(\text{MAX})} = (150^\circ\text{C} - 25^\circ\text{C}) / (30^\circ\text{C}/\text{W}) = 4.16\text{W}$$

for a WETD-VQFN-16L 3x3 package.

The maximum power dissipation depends on the operating ambient temperature for the fixed T<sub>J(MAX)</sub> and the thermal resistance, θ<sub>JA</sub>. The derating curve in [Figure 3](#) allows the designer to see the effect of rising ambient temperature on the maximum power dissipation.

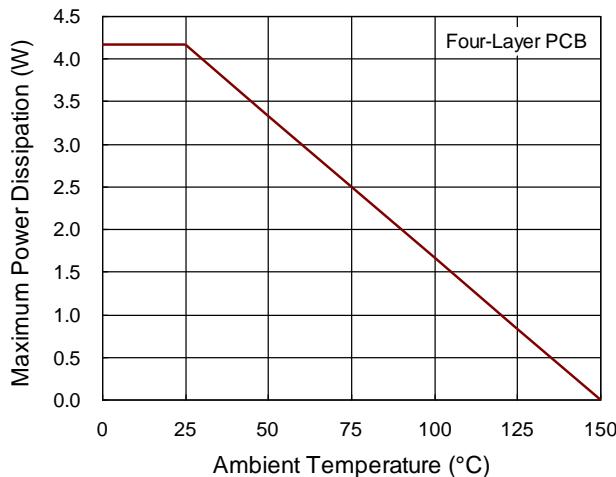

Figure 3. Derating Curve of Maximum Power Dissipation

## 16.6 Layout Considerations

The PCB layout is an important step to maintain the high performance of the RTQ2072A-QT/RTQ2072B-QT. Both the high current and the fast switching nodes demand full attention to the PCB layout to keep the robustness of the RTQ2072A-QT/RTQ2072B-QT through the PCB layout. Improper layout might lead to the symptoms of poor line or load regulation, ground and output voltage shifts, stability issues, unsatisfying EMI behavior or worsened efficiency. For the best performance of the RTQ2072A-QT/RTQ2072B-QT, the following PCB layout guidelines must be strictly followed.

- The trace from the switching node to the inductor should be kept as short as possible to minimize the switching loop for better EMI.
- Place the input and output capacitors as close as possible to the corresponding input and output pins to ensure optimal filtering performance.
- Keep the main power traces as wide and short as possible.
- Connect the AGND and PGND to a solid ground plane to improve thermal dissipation and enhance noise immunity.
- Directly connect the buck converter's output capacitor to the feedback network to minimize voltage fluctuations caused by parasitic resistance and inductance in the PCB traces.
